

Installing the Application Server

This chapter describes the process of installing the Servoy Application Server, which uses the same all-in-one installer to install the Servoy Developer IDE. The Application Server allows the deployment of Servoy solutions and can be installed as a standalone server on production machines.

Quick Start for the Impatient

This chapter is the Quick Start on running the installer. for more detailed descriptions see the sub chapters.

1. Open the Servoy installer file. The welcome message will appear, displaying the version/release number to be installed.
2. Click **Next**.
3. Review and accept the license agreement, then click **Next**.
4. Choose **Servoy Application Server** from the install options, then click **Next**.

5. Specify the installation path. Servoy will choose a default application path appropriate to the system you are using.
6. Select your desired database options.
 - The **bundled PostgreSQL database** is a basic installation of PostgreSQL without add-ons. This option provides a sample project database that is useful for those new to Servoy.
 - The **PostgreSQL Standard Server by EnterpriseDB** option automatically downloads and installs a full-featured PostgreSQL database (including the PgAdmin database admin tool and means to upgrade the database when new maintenance releases become available), and is an appropriate choice when installing the Servoy Application Server in a production environment. The sample database will not be installed by default when choosing this option.

Note: You will need to write down the database port and path locations during installation of PostgreSQL Standard Server for step 3 of this procedure.

- **Connect to an existing database** allows users to use databases that have already been installed and are running. If this option is chosen, the bundled PostgreSQL and sample databases will not be installed.
7. **Confirm or enter** the database configuration or connection details as appropriate:
 - **Bundled Postgre installation** – confirm or revise the information for Database server port, Database directory, and Database data directory.
 - **PostgreSQL Standard Server installation** – Enter the information noted during the third-party installation.
 - **Existing database connection** – Enter the database connection information (obtained from your database administrator) in this screen.
 8. **Confirm or enter** the ports you wish to assign to the application server, then click Next. Note: The Web Client will be served over the Application Server HTTP port, and the Smart Client will be served over the RMI port.
 - Click on Check Availability if you need to confirm the port's availability.
 9. Click **Next**. At this point, the application server files will be installed.
 10. When the [Finished] message appears on the progress bar, click **Next** to finalize the installation.

- You will see a confirmation message as well as a button to generate an unattended installation script in the following screen.
