SVN - Update

When a developer wants to get the latest changes made by other developers from the repository, they perform an update command in Servoy Developer.

Updating from the Repository

- 1. If any code is to be updated, there must be changes in the repository that do not exist in your local copy. If there are none, update will do nothing.
- 2. Right-click the active solution node and from the contextual popup menu, select **Team > Update to HEAD**. It should take a moment to download the changes and update the local copy. Once completed, you should now see your changes reflected locally.
