

Locale Settings

The Locale Settings are the default values for each started Servoy Client.

If specified on the Admin Page, they override the Locale Settings of the user environment.

Within a Solution the developer can choose to override Locale settings programmatically.

Within a Smart Client the user can manually override the Locale Settings as well through the Smart Client preferences.

For more information on Localization, see [Internationalization and Localization](#).

`locale.default`

The default locale for clients

`locale.numberformat`

The default number format

`locale.integerformat`

The default integer format

`locale.dateformat`

The default date format

`servoy.use.client.timezone`

When true, the clients time zone will be used to convert to the server/database time zone. It is highly recommended to use true as the default to always see the correct/same dates/times in all clients (regardless of their timezone). For more information, see [Working with Timezones](#).
