

Servoy Team Provider

The Servoy Team Provider is a team sharing system that uses the Servoy Application Server repository as its code repository. It is a very basic team sharing methodology, and is no longer the preferred method for utilizing team sharing. It does not require a separate installation in Servoy Developer.

The Servoy Team Provider cannot use an application server that is serving solutions to clients for its repository, the application server must be set to be a code repository server.

Both the server and the client must run the same version of Servoy and they must have the same values for `SocketFactory.useSSL` and `SocketFactory.useTwoWaySocket` in the `servoy.properties` configuration file and in case `SocketFactory.tunnelConnectionMode` is specified it must be set to `2waysocket`

A more preferred Team Provider is [SVN](#).
