

Column Settings

Property Summary

Number	#autoEnterSubType	The subtype of autoenter configured for the column.
Number	#autoEnterType	The type of autoenter configured for the column.
String	#converterName	The name of the converter used for this column.
String	#converterProperties	The properties of the converter used for this column.
String	#databaseDefaultValue	The database default value that is used when autoenter is set to database default.
String	#databaseSequenceName	The database sequence name that is used when autoenter is set to sequence and autoenter subtype is set to database sequence.
String	#defaultFormat	The default format of the column.
String	#defaultValue	The value that is used when autoenter is set to custom value.
String	#description	The description of the column.
String	#foreignType	The foreign type of the column.
String	#lookupValue	The lookup value that is used when autotype is set to lookup.
String	#titleText	The title of the column.
String	#validatorName	The name of the validator used for the column.
String	#validatorProperties	The properties of the validator used for the column.

Property Details

autoEnterSubType

The subtype of autoenter configured for the column. The available options depend on the type of autoenter.

If autoenter is set to system value, then the subtype can be one of: none, creation datetime, creation username, modification datetime, modification username, database managed, creation user uid, modification user uid, creation server datetime or modification server datetime.

If autoenter is set to sequence, then the subtype can be one of: none, Servoy sequence, database sequence, database identity or universally unique identifier.

Returns

Number

autoEnterType

The type of autoenter configured for the column. Can be one of: none, system value, sequence, custom value or lookup value.

Returns

Number

converterName

The name of the converter used for this column.

Returns

String

converterProperties

The properties of the converter used for this column.

Returns

String

databaseDefaultValue

The database default value that is used when autoenter is set to database default.

Returns

String

databaseSequenceName

The database sequence name that is used when autoenter is set to sequence and autoenter subtype is set to database sequence.

Returns[String](#)`defaultFormat`

The default format of the column.

Returns[String](#)`defaultValue`

The value that is used when autoenter is set to custom value.

Returns[String](#)`description`

The description of the column.

Returns[String](#)`foreignType`

The foreign type of the column. It is used for foreign key columns, to hold the foreign table they point to.

Returns[String](#)`lookupValue`

The lookup value that is used when autotype is set to lookup.

Returns[String](#)`titleText`

The title of the column.

Returns[String](#)`validatorName`

The name of the validator used for the column.

Returns[String](#)`validatorProperties`

The properties of the validator used for the column.

Returns[String](#)
