

# On premises deployment

On premises deployment typically means that the application server is located on the same premises as the users of an application.

Optimal configuration:

- Dedicated Servoy server
- 100 or 1000 Mbit network connection
- no firewalls or proxies between server and clients
- 2 way socket enabled
- Java 6 or higher
- http tunnel disabled

Servoy wil run fine without the optimal configuration but with the configuration above there will be less cpu usage, less memory usage, better performance and less potential network issues
