Software as a Service (SaaS) deployment

Servoy can also be deployed using SaaS. There are a couple of ways to do this:

- on your own infrastructure (at a datacenter or not)
- in the cloud, see Deployment in the Cloud

Servoy supports the main three SaaS paradigms:

- Multi tenancy: all data is stored in a single database and the Servoy application separates the data
- Multi database: one database per customer/tenant
- ASP: One installation per client.

For SaaS deployment the server installation and management is identical to a normal installation.
