

Servoy Repository upgrade

The [Servoy Repository](#) is a set of tables in the database underlying the database server connection named 'repository_server' in Servoy. The datamodel structure is versioned, so new version of Servoy might require an upgrade of the repository.

The datamodel can be both **created** and **upgraded** command line.

To create or upgrade the [Servoy Repository](#) data model, shut down the Servoy Application Server if it's running, open a command line or terminal window and execute the following command in the {servoyInstall}/application_server/ directory:

Macintosh/Linux/Unix

```
./servoy_server.sh -upgradeRepository
```

Windows

```
servoy_server.bat -upgradeRepository
```

Executing the aforementioned command start the Servoy Application Server and will create or upgrade the table structure required for the [Servoy Repository](#) to the version the Servoy Application Server requires.

Create a backup first

Before performing an upgrade, always make a backup first
