[JSComponent](#)

## Property Summary

	<b>#anchors</b>
Number	Enables a component to stick to a specific side of form and/or to grow or shrink when a window is resized.
	<b>#background</b>
String	The background color of the component.
	<b>#borderType</b>
String	The type, color and style of border of the component.
	<b>#enabled</b>
Boolean	The enable state of the component, default true.
	<b>#fontType</b>
String	The font type of the component.
	<b>#foreground</b>
String	The foreground color of the component.
	<b>#formIndex</b>
Number	The Z index of this component.
	<b>#groupID</b>
String	A String representing a group ID for this component.
	<b>#height</b>
Number	The height in pixels of the component.
	<b>#initialSort</b>
String	The default sort order for the rows displayed in the portal.
	<b>#multiLine</b>
Boolean	When set, portal rows can have a custom layout of fields, buttons, etc.
	<b>#name</b>
String	The name of the component.
	<b>#onDrag</b>
JSMethod	The method that is triggered when (non Design Mode) dragging occurs.
	<b>#onDragEnd</b>
JSMethod	The method that is triggered when (non Design Mode) dragging end occurs.
	<b>#onDragOver</b>
JSMethod	The method that is triggered when (non Design Mode) dragging over a component occurs.
	<b>#onDrop</b>
JSMethod	The method that is triggered when (non Design Mode) dropping occurs.
	<b>#onRender</b>
JSMethod	The method that is executed when the component is rendered.
	<b>#printSliding</b>
Number	Enables an element to resize based on its content and/or move when printing.
	<b>#printable</b>
Boolean	Flag that tells if the component should be printed or not when the form is printed.
	<b>#relationName</b>
String	The name of the relationship between the table related to the currently active form and the table you want to show data from in the portal.
	<b>#reorderable</b>
Boolean	When set, the portal rows can be re-ordered by dragging the column headers.
	<b>#resizable</b>
Boolean	When set the portal rows can be resized by users.
	<b>#rowHeight</b>
Number	The height of each row in pixels.
	<b>#scrollbars</b>
Number	Scrollbar options for the vertical and horizontal scrollbars.
	<b>#showHorizontalLines</b>
Boolean	When set, the portal displays horizontal lines between the rows.
	<b>#showVerticalLines</b>
Boolean	When set the portal displays vertical lines between the columns.
	<b>#sortable</b>
Boolean	When set, users can sort the contents of the portal by clicking on the column headings.
	<b>#styleClass</b>
String	The name of the style class that should be applied to this component.
	<b>#tabSeq</b>
Number	An index that specifies the position of the component in the tab sequence.
	<b>#transparent</b>
Boolean	Flag that tells if the component is transparent or not.
	<b>#visible</b>
Boolean	The visible property of the component, default true.
	<b>#width</b>
Number	The width in pixels of the component.
	<b>#x</b>
Number	The x coordinate of the component on the form.
	<b>#y</b>
Number	The y coordinate of the component on the form.

## Method Summary

JSButton	<code>#getButton(name)</code>	Retrieves a button from the portal based on the name of the button.
JSButton[]	<code>#getButtons()</code>	Retrieves an array with all buttons in the portal.
Object	<code>#getDesignTimeProperty()</code>	Get a design-time property of an element.
JSField	<code>#getField(name)</code>	Retrieves a field from this portal based on the name of the field.
JSField[]	<code>#getFields()</code>	Retrieves an array with all fields in a portal.
String	<code>#getInterCellSpacing()</code>	The additional spacing between cell rows.
JLabel	<code>#getLabel(name)</code>	Retrieves a label from this portal based on the name of the label.
JLabel[]	<code>#getLabels()</code>	Retrieves all labels from the portal.
UUID	<code>#getUUID()</code>	Returns the UUID of this component.
JSButton	<code>#newButton(text, x, width, height, action)</code>	Creates a new button on the portal with the given text, place, size and JSMethod as the onClick action.
JSField	<code>#newCalendar(dataprovider, x, width, height)</code>	Creates a new calendar field in the portal.
JSField	<code>#newCheck(dataprovider, x, width, height)</code>	Creates a new checkbox field in the portal.
JSField	<code>#newComboBox(dataprovider, x, width, height)</code>	Creates a new combobox field in the portal.
JSField	<code>#newField(dataprovider, displaytype, x, width, height)</code>	Creates a new field on this form.
JSField	<code>#newHtmlArea(dataprovider, x, width, height)</code>	Creates a new HTML Area field in the portal.
JSField	<code>#newImageMedia(dataprovider, x, width, height)</code>	Creates a new Image Media field in the portal.
JLabel	<code>#newLabel(txt, x, width, height)</code>	Creates a new label on the form, with the given text, place and size.
JLabel	<code>#newLabel(text, x, width, height, action)</code>	Creates a new label on the form, with the given text, place, size and an JSMethod as the onClick action.
JSField	<code>#newPassword(dataprovider, x, width, height)</code>	Creates a new password field in the portal.
JSField	<code>#newRadios(dataprovider, x, width, height)</code>	Creates a new radio buttons field in the portal.
JSField	<code>#newRtfArea(dataprovider, x, width, height)</code>	Creates a new RTF Area field in the portal.
JSField	<code>#newTextArea(dataprovider, x, width, height)</code>	Creates a new text area field in the portal.
JSField	<code>#newTextField(dataprovider, x, width, height)</code>	Creates a new text field in the portal.
JSField	<code>#newTypeAhead(dataprovider, x, width, height)</code>	Creates a new type ahead field in the portal.
Object	<code>#putDesignTimeProperty()</code>	Set a design-time property of an element.
Object	<code>#removeDesignTimeProperty()</code>	Clear a design-time property of an element.
void	<code>#setInterCellSpacing(width, height)</code>	The additional spacing between cell rows.

## Property Details

### anchors

Enables a component to stick to a specific side of form and/or to grow or shrink when a window is resized.

If opposite anchors are activated then the component with grow or shrink with the window. For example if Top and Bottom are activated, then the component will grow/shrink when the window is vertically resized. If Left and Right are activated then the component will grow/shrink when the window is horizontally resized.

If opposite anchors are not activated, then the component will keep a constant distance from the sides of the window which correspond to the activated anchors.

#### Returns

#### Number

#### Sample

```
var form = solutionModel.newForm('mediaForm', 'db:/example_data/parent_table', null, false, 400, 300);
var stretchAllDirectionsLabel = form.newLabel('Strech all directions', 10, 10, 380, 280);
stretchAllDirectionsLabel.background = 'red';
stretchAllDirectionsLabel.anchors = SM_ANCHOR.ALL;
var stretchVerticallyLabel = form.newLabel('Strech vertically', 10, 10, 190, 280);
stretchVerticallyLabel.background = 'green';
stretchVerticallyLabel.anchors = SM_ANCHOR.WEST | SM_ANCHOR.NORTH | SM_ANCHOR.SOUTH;
var stretchHorizontallyLabel = form.newLabel('Strech horizontally', 10, 10, 380, 140);
stretchHorizontallyLabel.background = 'blue';
stretchHorizontallyLabel.anchors = SM_ANCHOR.NORTH | SM_ANCHOR.WEST | SM_ANCHOR.EAST;
var stickToTopLeftCornerLabel = form.newLabel('Stick to top-left corner', 10, 10, 200, 100);
stickToTopLeftCornerLabel.background = 'orange';
stickToTopLeftCornerLabel.anchors = SM_ANCHOR.NORTH | SM_ANCHOR.WEST; // This is equivalent to SM_ANCHOR.DEFAULT
var stickToBottomRightCornerLabel = form.newLabel('Stick to bottom-right corner', 190, 190, 200, 100);
stickToBottomRightCornerLabel.background = 'pink';
stickToBottomRightCornerLabel.anchors = SM_ANCHOR.SOUTH | SM_ANCHOR.EAST;
```

### background

The background color of the component.

#### Returns

#### String

#### Sample

```
// This property can be used on all types of components.
// Here it is illustrated only for labels and fields.
var greenLabel = form.newLabel('Green',10,10,100,50);
greenLabel.background = 'green'; // Use generic names for colors.
var redField = form.newField('parent_table_text',JSField.TEXT_FIELD,10,110,100,30);
redField.background = '#FF0000'; // Use RGB codes for colors.
```

### borderType

The type, color and style of border of the component.

#### Returns

#### String

#### Sample

```
//HINT: To know exactly the notation of this property set it in the designer and then read it once out through the solution model.
var field = form.newField('my_table_text', JSField.TEXT_FIELD, 10, 10, 100, 20);
field.borderType = solutionModel.createBorder(1,'#ff0000');
```

**enabled**

The enable state of the component, default true.

**Returns****Boolean****Sample**

```
var form = solutionModel.newForm('printForm', 'db:/example_data/parent_table', null, false, 400, 300);
var field = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 10, 100, 20);
field.enabled = false;
```

**fontType**

The font type of the component.

**Returns****String****Sample**

```
var label = form.newLabel('Text here', 10, 50, 100, 20);
label.fontType = solutionModel.createFont('Times New Roman', 1, 14);
```

**foreground**

The foreground color of the component.

**Returns****String****Sample**

```
// This property can be used on all types of components.
// Here it is illustrated only for labels and fields.
var labelWithBlueText = form.newLabel('Blue text', 10, 10, 100, 30);
labelWithBlueText.foreground = 'blue'; // Use generic names for colors.
var fieldWithYellowText = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 50, 100, 20);
fieldWithYellowText.foreground = '#FFFF00'; // Use RGB codes for colors.
```

**formIndex**

The Z index of this component. If two components overlap, then the component with higher Z index is displayed above the component with lower Z index.

**Returns****Number****Sample**

```
var labelBelow = form.newLabel('Green', 10, 10, 100, 50);
labelBelow.background = 'green';
labelBelow.formIndex = 10;
var fieldAbove = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 10, 100, 30);
fieldAbove.background = '#FF0000';
fieldAbove.formIndex = 20;
```

**groupId**

A String representing a group ID for this component. If several components have the same group ID then they belong to the same group of components. Using the group itself, all components can be disabled/enabled or made invisible/visible.

The group id should be a javascript compatible identifier to allow access of the group in scripting.

**Returns****String****Sample**

```
var form = solutionModel.newForm('someForm', 'db:/example_data/parent_table', null, false, 400, 300);
var label = form.newLabel('Green', 10, 10, 100, 20);
var field = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 40, 100, 20);
label.groupID = 'someGroup';
field.groupID = 'someGroup';
forms['someForm'].elements.someGroup.enabled = false;
```

**height**

The height in pixels of the component.

**Returns****Number****Sample**

```
var field = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 10, 100, 20);
application.output('original width: ' + field.width);
application.output('original height: ' + field.height);
field.width = 200;
field.height = 100;
application.output('modified width: ' + field.width);
application.output('modified height: ' + field.height);
```

**initialSort**

The default sort order for the rows displayed in the portal.

**Returns****String****Sample**

```
var childrenPortal = form.newPortal('pp', rel, 10, 10, 620, 460);
childrenPortal.newTextField('child_table_id', 0, 100, 20);
childrenPortal.newTextField('child_table_text', 100, 100, 20);
childrenPortal.newTextField('child_table_parent_id', 200, 100, 20);
childrenPortal.initialSort = 'child_table_text desc';
```

**multiLine**

When set, portal rows can have a custom layout of fields, buttons, etc. displayed for each matching row (rather than the default "grid").

**Returns****Boolean****Sample**

```
var childrenPortal = form.newPortal('pp', rel, 10, 10, 620, 460);
// Set the fields some distance apart horizontally. By default this distance
// is ignored and the components are put in a grid.
var idField = childrenPortal.newTextField('child_table_id', 0, 100, 20);
idField.background = 'yellow';
var textField = childrenPortal.newTextField('child_table_text', 150, 100, 20);
textField.background = 'green';
var parentIdField = childrenPortal.newTextField('child_table_parent_id', 300, 100, 20);
parentIdField.background = 'orange';
// Disable the grid placing of components, and make the distance between components
// become active.
childrenPortal.multiLine = true;
```

**name**

The name of the component. Through this name it can also accessed in methods.

**Returns**

[String](#)

**Sample**

```
var form = solutionModel.newForm('someForm', 'db:/example_data/parent_table', null, false, 620, 300);
var label = form.newLabel('Label', 10, 10, 150, 150);
label.name = 'myLabel'; // Give a name to the component.
forms['someForm'].controller.show()
// Now use the name to access the component.
forms['someForm'].elements['myLabel'].text = 'Updated text';
```

**onDrag**

The method that is triggered when (non Design Mode) dragging occurs.

**Returns**

[JSMethod](#)

**Sample**

```
form.onDrag = form.newMethod('function onDrag(event) { application.output("onDrag intercepted from " + event.
getSource()); }');
form.onDragEnd = form.newMethod('function onDragEnd(event) { application.output("onDragEnd intercepted from " +
event.getSource()); }');
form.onDragOver = form.newMethod('function onDragOver(event) { application.output("onDragOver intercepted from
" + event.getSource()); }');
form.onDrop = form.newMethod('function onDrop(event) { application.output("onDrop intercepted from " + event.
getSource()); }');
```

**onDragEnd**

The method that is triggered when (non Design Mode) dragging end occurs.

**Returns**

[JSMethod](#)

**Sample**

```
form.onDrag = form.newMethod('function onDrag(event) { application.output("onDrag intercepted from " + event.
getSource()); }');
form.onDragEnd = form.newMethod('function onDragEnd(event) { application.output("onDragEnd intercepted from " +
event.getSource()); }');
form.onDragOver = form.newMethod('function onDragOver(event) { application.output("onDragOver intercepted from
" + event.getSource()); }');
form.onDrop = form.newMethod('function onDrop(event) { application.output("onDrop intercepted from " + event.
getSource()); }');
```

**onDragOver**

The method that is triggered when (non Design Mode) dragging over a component occurs.

**Returns**

[JSMethod](#)

**Sample**

```
form.onDrag = form.newMethod('function onDrag(event) { application.output("onDrag intercepted from " + event.
getSource()); }');
form.onDragEnd = form.newMethod('function onDragEnd(event) { application.output("onDragEnd intercepted from " +
event.getSource()); }');
form.onDragOver = form.newMethod('function onDragOver(event) { application.output("onDragOver intercepted from
" + event.getSource()); }');
form.onDrop = form.newMethod('function onDrop(event) { application.output("onDrop intercepted from " + event.
getSource()); }');
```

### onDrop

The method that is triggered when (non Design Mode) dropping occurs.

#### Returns

JSMethod

#### Sample

```
form.onDrag = form.newMethod('function onDrag(event) { application.output("onDrag intercepted from " + event.getSource()); }');
form.onDragEnd = form.newMethod('function onDragEnd(event) { application.output("onDragEnd intercepted from " + event.getSource()); }');
form.onDragOver = form.newMethod('function onDragOver(event) { application.output("onDragOver intercepted from " + event.getSource()); }');
form.onDrop = form.newMethod('function onDrop(event) { application.output("onDrop intercepted from " + event.getSource()); }');
```

### onRender

The method that is executed when the component is rendered.

#### Returns

JSMethod

#### Sample

```
portal.onRender = form.newMethod('function onRender(event) { event.getElement().bgcolor = \'#00ff00\' }');
```

### printSliding

Enables an element to resize based on its content and/or move when printing.

The component can move horizontally or vertically and can grow or shrink in height and width, based on its content and the content of neighboring components.

#### Returns

Number

#### Sample

```
var form = solutionModel.newForm('printForm', 'db:/example_data/parent_table', null, false, 400, 300);
var slidingLabel = form.newLabel('Some long text here', 10, 10, 5, 5);
slidingLabel.printSliding = SM_PRINT_SLIDING.GROW_HEIGHT | SM_PRINT_SLIDING.GROW_WIDTH;
slidingLabel.background = 'gray';
forms['printForm'].controller.showPrintPreview();
```

### printable

Flag that tells if the component should be printed or not when the form is printed.

By default components are printable.

#### Returns

Boolean

#### Sample

```
var form = solutionModel.newForm('printForm', 'db:/example_data/parent_table', null, false, 400, 300);
var printedField = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 10, 100, 20);
var notPrintedField = form.newField('parent_table_id', JSField.TEXT_FIELD, 10, 40, 100, 20);
notPrintedField.printable = false; // This field won't show up in print preview and won't be printed.
forms['printForm'].controller.showPrintPreview()
```

**relationName**

The name of the relationship between the table related to the currently active form and the table you want to show data from in the portal.

**Returns****String****Sample**

```
// Create the portal based on one relation.  
var childrenPortal = form.newPortal('pp', 'parent_to_child', 10, 10, 620, 460);  
var idField = childrenPortal.newTextField('child_table_id', 0, 100, 20);  
var textField = childrenPortal.newTextField('child_table_text',150,100,20);  
var parentIdField = childrenPortal.newTextField('child_table_parent_id', 300, 100, 20);  
// Now make the portal be based on another relation.  
childrenPortal.relationName = 'parent_to_smaller_children';
```

**reorderable**

When set, the portal rows can be re-ordered by dragging the column headers.

**Returns****Boolean****Sample**

```
var childrenPortal = form.newPortal('pp', 'parent_to_child', 10, 10, 620, 460);  
childrenPortal.newTextField('child_table_id', 0, 100, 20);  
childrenPortal.newTextField('child_table_text',150,100,20);  
childrenPortal.newTextField('child_table_parent_id', 300, 100, 20);  
childrenPortal.reorderable = true;
```

**resizable**

When set the portal rows can be resized by users.

**Returns****Boolean****Sample**

```
var childrenPortal = form.newPortal('pp', 'parent_to_child', 10, 10, 620, 460);  
childrenPortal.newTextField('child_table_id', 0, 100, 20);  
childrenPortal.newTextField('child_table_text',150,100,20);  
childrenPortal.newTextField('child_table_parent_id', 300, 100, 20);  
// Make the columns resizable. By default they are not resizable.  
childrenPortal.resizable = true;
```

**rowHeight**

The height of each row in pixels. If 0 or not set, the height defaults to 10.

**Returns****Number****Sample**

```
var childrenPortal = form.newPortal('pp', 'parent_to_child', 10, 10, 620, 460);  
childrenPortal.newTextField('child_table_id', 0, 100, 20);  
childrenPortal.newTextField('child_table_text',150,100,20);  
childrenPortal.newTextField('child_table_parent_id', 300, 100, 20);  
childrenPortal.rowHeight = 30;
```

## scrollbars

Scrollbar options for the vertical and horizontal scrollbars. Each of the vertical and horizontal scrollbars can be configured to display all the time, to display only when needed or to never display.

**Returns**

**Number**

**Sample**

```
var noScrollbars = form.newField('my_table_text', JSField.TEXT_AREA, 10, 10, 100, 100);
noScrollbars.scrollbars = SM_SCROLLBAR.HORIZONTAL_SCROLLBAR_NEVER | SM_SCROLLBAR.VERTICAL_SCROLLBAR_NEVER;
var neededScrollbars = form.newField('my_table_text', JSField.TEXT_AREA, 120, 10, 100, 100);
neededScrollbars.scrollbars = SM_SCROLLBAR.HORIZONTAL_SCROLLBAR_AS_NEEDED | SM_SCROLLBAR.VERTICAL_SCROLLBAR_AS_NEEDED;
var alwaysScrollbars = form.newField('my_table_text', JSField.TEXT_AREA, 230, 10, 100, 100);
alwaysScrollbars.scrollbars = SM_SCROLLBAR.HORIZONTAL_SCROLLBAR_ALWAYS | SM_SCROLLBAR.VERTICAL_SCROLLBAR_ALWAYS;
```

## showHorizontalLines

When set, the portal displays horizontal lines between the rows.

**NOTE:**

In a multi-line portal, a horizontal line is only displayed in the selected row; to display a horizontal line in all rows, add a line to the portal.

**Returns**

**Boolean**

**Sample**

```
var childrenPortal = form.newPortal('pp', 'parent_to_child', 10, 10, 620, 460);
childrenPortal.newTextField('child_table_id', 0, 100, 20);
childrenPortal.newTextField('child_table_text', 150, 100, 20);
childrenPortal.newTextField('child_table_parent_id', 300, 100, 20);
childrenPortal.showHorizontalLines = true;
childrenPortal.showVerticalLines = true;
```

## showVerticalLines

When set the portal displays vertical lines between the columns.

**NOTE:**

In a multi-line portal, a vertical line is only displayed in the selected row; to display a vertical line in all rows, add a line to the portal.

**Returns**

**Boolean**

**Sample**

```
var childrenPortal = form.newPortal('pp', 'parent_to_child', 10, 10, 620, 460);
childrenPortal.newTextField('child_table_id', 0, 100, 20);
childrenPortal.newTextField('child_table_text', 150, 100, 20);
childrenPortal.newTextField('child_table_parent_id', 300, 100, 20);
childrenPortal.showHorizontalLines = true;
childrenPortal.showVerticalLines = true;
```

## sortable

When set, users can sort the contents of the portal by clicking on the column headings.

**Returns**

**Boolean**

**Sample**

```
var childrenPortal = form.newPortal('pp', 'parent_to_child', 10, 10, 620, 460);
childrenPortal.newTextField('child_table_id', 0, 100, 20);
childrenPortal.newTextField('child_table_text', 150, 100, 20);
childrenPortal.newTextField('child_table_parent_id', 300, 100, 20);
childrenPortal.sortable = true;
```

#### styleClass

The name of the style class that should be applied to this component.

When defining style classes for specific component types, their names must be prefixed according to the type of the component. For example in order to define a class named 'fancy' for fields, in the style definition the class must be named 'field.fancy'. If it would be intended for labels, then it would be named 'label.fancy'. When specifying the class name for a component, the prefix is dropped however. Thus the field or the label will have its styleClass property set to 'fancy' only.

#### Returns

String

#### Sample

```
var form = solutionModel.newForm('printForm', 'db:/example_data/parent_table', null, false, 400, 300);
var field = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 10, 100, 20);
var style = solutionModel.newStyle('myStyle','field.fancy { background-color: yellow; }');
form.styleName = 'myStyle'; // First set the style on the form.
field.styleClass = 'fancy'; // Then set the style class on the field.
```

#### tabSeq

An index that specifies the position of the component in the tab sequence. The components are put into the tab sequence in increasing order of this property. A value of 0 means to use the default mechanism of building the tab sequence (based on their location on the form). A value of -2 means to remove the component from the tab sequence.

#### Returns

Number

#### Sample

```
// Create three fields. Based on how they are placed, by default they will come one
// after another in the tab sequence.
var fieldOne = form.newField('parent_table_id', JSField.TEXT_FIELD, 10, 10, 100, 20);
var fieldTwo = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 40, 100, 20);
var fieldThree = form.newField('parent_table_id', JSField.TEXT_FIELD, 10, 70, 100, 20);
// Set the third field come before the first in the tab sequence, and remove the
// second field from the tab sequence.
fieldOne.tabSeq = 2;
fieldTwo.tabSeq = SM_DEFAULTS.IGNORE;
fieldThree.tabSeq = 1;
```

#### transparent

Flag that tells if the component is transparent or not.

The default value is "false", that is the components are not transparent.

#### Returns

Boolean

#### Sample

```
// Load an image from disk and create a Media object based on it.
var imageBytes = plugins.file.readFile('d:/ball.jpg');
var media = solutionModel.newMedia('ball.jpg', imageBytes);
// Put on the form a label with the image.
var image = form.newLabel('', 10, 10, 100, 100);
image.imageMedia = media;
// Put two fields over the image. The second one will be transparent and the
// image will shine through.
var nonTransparentField = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 20, 100, 20);
var transparentField = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 50, 100, 20);
transparentField.transparent = true;
```

**visible**

The visible property of the component, default true.

**Returns**

[Boolean](#)

**Sample**

```
var form = solutionModel.newForm('printForm', 'db:/example_data/parent_table', null, false, 400, 300);
var field = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 10, 100, 20);
field.visible = false;
```

**width**

The width in pixels of the component.

**Returns**

[Number](#)

**Sample**

```
var field = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 10, 100, 20);
application.output('original width: ' + field.width);
application.output('original height: ' + field.height);
field.width = 200;
field.height = 100;
application.output('modified width: ' + field.width);
application.output('modified height: ' + field.height);
```

**x**

The x coordinate of the component on the form.

**Returns**

[Number](#)

**Sample**

```
var field = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 10, 100, 20);
application.output('original location: ' + field.x + ', ' + field.y);
field.x = 90;
field.y = 90;
application.output('changed location: ' + field.x + ', ' + field.y);
```

**y**

The y coordinate of the component on the form.

**Returns**

[Number](#)

**Sample**

```
var field = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 10, 100, 20);
application.output('original location: ' + field.x + ', ' + field.y);
field.x = 90;
field.y = 90;
application.output('changed location: ' + field.x + ', ' + field.y);
```

## Method Details

**getButton**

**JSButton getButton(name)**

Retrieves a button from the portal based on the name of the button.

**Parameters**

{[String](#)} name – The name of the button to retrieve.

**Returns**

[JSButton](#) – A JButton instance that corresponds to the button with the specified name.

## Sample

```
var clickMethod = form.newMethod('function clickMe() { application.output("I was clicked!"); }');
var childrenPortal = form.newPortal('pp', 'parent_to_child', 10, 10, 620, 460);
var btn = childrenPortal.newButton('Click me!', 400, 100, 20, clickMethod);
btn.name = 'clickMeBtn'; // Give a name to the button, so we can retrieve it by name later.
// Retrieve the button by name and do something with it.
var btnBack = childrenPortal.getButton('clickMeBtn');
btnBack.background = 'yellow';
// Retrieve the button through the array of all buttons and do something with it.
var allButtons = childrenPortal.getButtons();
var btnBackAgain = allButtons[0];
btnBackAgain.foreground = 'red';
```

## getButtons

### **JSButton[] getButtons()**

Retrieves an array with all buttons in the portal.

#### Returns

**JSButton[]** – An array with all buttons in the portal.

## Sample

```
var clickMethod = form.newMethod('function clickMe() { application.output("I was clicked!"); }');
var childrenPortal = form.newPortal('pp', 'parent_to_child', 10, 10, 620, 460);
var btn = childrenPortal.newButton('Click me!', 400, 100, 20, clickMethod);
btn.name = 'clickMeBtn'; // Give a name to the button, so we can retrieve it by name later.
// Retrieve the button by name and do something with it.
var btnBack = childrenPortal.getButton('clickMeBtn');
btnBack.background = 'yellow';
// Retrieve the button through the array of all buttons and do something with it.
var allButtons = childrenPortal.getButtons();
var btnBackAgain = allButtons[0];
btnBackAgain.foreground = 'red';
```

## getDesignTimeProperty

### **Object getDesignTimeProperty()**

Get a design-time property of an element.

#### Returns

**Object**

## Sample

```
var frm = solutionModel.getForm('orders')
var fld = frm.getField('fld')
var prop = fld.getDesignTimeProperty('myprop')
```

## getField

### **JSField getField(name)**

Retrieves a field from this portal based on the name of the field.

#### Parameters

**{String}** name – The name of the field to retrieve.

#### Returns

**JSField** – A JSField instance corresponding to the field with the specified name.

## Sample

```
var childrenPortal = form.newPortal('pp', 'parent_to_my_table', 10, 10, 1180, 780);
var cal = childrenPortal.newField('my_table_date', JSField.CALENDAR, 0, 60, 20);
var tfield = childrenPortal.newField('my_table_text', JSField.TEXT_FIELD, 60, 60, 20);
tfield.name = 'textField'; // Give a name to the field so we can retrieve it later by name.
// Retrieve the text field by its name and do something with it.
var textFieldBack = childrenPortal.getField('textField');
textFieldBack.background = 'yellow';
// Retrieve the calendar field through the array of all fields and do something with it.
var allFields = childrenPortal.getFields();
var calFieldBack = allFields[0];
calFieldBack.foreground = 'red';
```

## getFields

### **JSField[] getFields()**

Retrieves an array with all fields in a portal.

#### Returns

**JSField[]** – An array with JSField instances corresponding to all fields in the portal.

## Sample

```
var childrenPortal = form.newPortal('pp', 'parent_to_my_table', 10, 10, 1180, 780);
var cal = childrenPortal.newField('my_table_date', JSField.CALENDAR, 0, 60, 20);
var tfield = childrenPortal.newField('my_table_text', JSField.TEXT_FIELD, 60, 60, 20);
tfield.name = 'textField'; // Give a name to the field so we can retrieve it later by name.
// Retrieve the text field by its name and do something with it.
var textFieldBack = childrenPortal.getField('textField');
textFieldBack.background = 'yellow';
// Retrieve the calendar field through the array of all fields and do something with it.
var allFields = childrenPortal.getFields();
var calFieldBack = allFields[0];
calFieldBack.foreground = 'red';
```

## getInterCellSpacing

### **String getInterCellSpacing()**

The additional spacing between cell rows. Is composed from the horizontal spacing and the vertical spacing.

#### Returns

**String** – A java.awt.Dimension object holding the horizontal and vertical intercell spacing.

## Sample

```
var spacing = childrenPortal.getInterCellSpacing();
application.output("horizontal spacing: " + spacing.width);
application.output("vertical spacing: " + spacing.height);
```

## getLabel

### **JLabel getLabel(name)**

Retrieves a label from this portal based on the name of the label.

#### Parameters

**{String}** name – The name of the label to retrieve.

#### Returns

**JLabel** – A JLabel instance corresponding to the label with the specified name.

## Sample

```
var callLabel = childrenPortal.newLabel('Date', 120, 60, 20);
var textLabel = childrenPortal.newLabel('Text', 180, 60, 20);
textLabel.name = 'textLabel'; // Give a name to this label, so we can retrieve it by name.
// Retrieve the second label by name.
var textLabelBack = childrenPortal.getLabel('textLabel');
textLabelBack.background = 'yellow';
// Retrieve the first label through the array of all labels.
var allLabels = childrenPortal.getLabels();
var callLabelBack = allLabels[0];
callLabelBack.foreground = 'red';
```

## getLabels

### **JSLABEL[] getLabels()**

Retrieves all labels from the portal.

#### Returns

**JSLABEL[]** – An array of JSLABEL instances corresponding to all labels in the portal.

## Sample

```
var callLabel = childrenPortal.newLabel('Date', 120, 60, 20);
var textLabel = childrenPortal.newLabel('Text', 180, 60, 20);
textLabel.name = 'textLabel'; // Give a name to this label, so we can retrieve it by name.
// Retrieve the second label by name.
var textLabelBack = childrenPortal.getLabel('textLabel');
textLabelBack.background = 'yellow';
// Retrieve the first label through the array of all labels.
var allLabels = childrenPortal.getLabels();
var callLabelBack = allLabels[0];
callLabelBack.foreground = 'red';
```

## getUUID

### **UUID getUUID()**

Returns the UUID of this component.

#### Returns

**UUID**

## Sample

```
var button_uuid = solutionModel.getForm("my_form").getButton("my_button").getUUID();
application.output(button_uuid.toString());
```

## newButton

### **JSPBUTTON newButton(text, x, width, height, action)**

Creates a new button on the portal with the given text, place, size and JSMethod as the onClick action.

#### Parameters

**{String}** text – The text to be displayed on the button.

**{Number}** x – The x coordinate of the button. If the portal does not have the "multiLine" property set, then the x coordinates are used only for determining the order of the columns in the grid. If the portal has the "multiLine" property set, then the components are actually displayed at the specified coordinates.

**{Number}** width – The width of the button.

**{Number}** height – The height of the button. In a portal the height of all components is set to the height of the first component, unless the "multiLine" property is set.

**{Object}** action – The JSMethod object that should be executed when the button is clicked.

#### Returns

**JSPBUTTON** – A JSPBUTTON instance representing the newly created button.

## Sample

```
var clickMethod = form.newMethod('function clickMe() { application.output("I was clicked!"); }');
var childrenPortal = form.newPortal('pp', 'parent_to_child', 10, 10, 620, 460);
childrenPortal.newButton('Click me!', 400, 100, 20, clickMethod);
```

## newCalendar

### **JSPFIELD newCalendar(dataprovider, x, width, height)**

Creates a new calendar field in the portal. It is equivalent to calling "newField" with the type JSPFIELD.CALENDAR.

#### Parameters

{Object} dataprovider – The data provider for this field. Can be either a column name, or an instance of JSVariable.  
{Number} x – The x coordinate of the field. If the portal does not have the "multiLine" property set, then the x coordinates are used only for determining the order of the columns in the grid. If the portal has the "multiLine" property set, then the components are actually displayed at the specified coordinates.  
{Number} width – The width of the field.  
{Number} height – The height of the field. In a portal the height of all components is set to the height of the first component, unless the "multiLine" property is set.

#### Returns

**JSField** – A JSField instance that corresponds to the newly created calendar.

#### Sample

```
var childrenPortal = form.newPortal('pp', 'parent_to_my_table', 10, 10, 1180, 780);
var cal = childrenPortal.newCalendar('my_table_date', 0, 60, 20);
```

#### newCheck

**JSField newCheck(dataprovider, x, width, height)**

Creates a new checkbox field in the portal. It is equivalent to calling "newField" with the type JSField.CHECKS.

#### Parameters

{Object} dataprovider – The data provider for this field. Can be either a column name, or an instance of JSVariable.  
{Number} x – The x coordinate of the field. If the portal does not have the "multiLine" property set, then the x coordinates are used only for determining the order of the columns in the grid. If the portal has the "multiLine" property set, then the components are actually displayed at the specified coordinates.  
{Number} width – The width of the field.  
{Number} height – The height of the field. In a portal the height of all components is set to the height of the first component, unless the "multiLine" property is set.

#### Returns

**JSField** – A JSField instance that corresponds to the newly created checkbox field.

#### Sample

```
var childrenPortal = form.newPortal('pp', 'parent_to_my_table', 10, 10, 1180, 780);
var vlist = solutionModel.newValueList('options', JSValueList.CUSTOM_VALUES);
vlist.customValues = "one\ntwo\nthree\nfour";
var chk = childrenPortal.newCheck('my_table_options', 60, 60, 50);
chk.valuelist = vlist;
```

#### newComboBox

**JSField newComboBox(dataprovider, x, width, height)**

Creates a new combobox field in the portal. It is equivalent to calling "newField" with the type JSField.COMBOBOX.

#### Parameters

{Object} dataprovider – The data provider for this field. Can be either a column name, or an instance of JSVariable.  
{Number} x – The x coordinate of the field. If the portal does not have the "multiLine" property set, then the x coordinates are used only for determining the order of the columns in the grid. If the portal has the "multiLine" property set, then the components are actually displayed at the specified coordinates.  
{Number} width – The width of the field.  
{Number} height – The height of the field. In a portal the height of all components is set to the height of the first component, unless the "multiLine" property is set.

#### Returns

**JSField** – A JSField instance that corresponds to the newly created combobox field.

#### Sample

```
var childrenPortal = form.newPortal('pp', 'parent_to_my_table', 10, 10, 1180, 780);
var vlist = solutionModel.newValueList('options', JSValueList.CUSTOM_VALUES);
vlist.customValues = "one\ntwo\nthree\nfour";
var cmb = childrenPortal.newComboBox('my_table_options', 120, 160, 20);
cmb.valuelist = vlist;
```

#### newField

**JSField newField(dataprovider, displaytype, x, width, height)**

Creates a new field on this form. The type of the field is specified by using one of the JSField constants like JSField.TEXT\_FIELD.

#### Parameters

{Object} dataprovider – The data provider for this field. Can be either a column name, or an instance of JSVariable.  
{Number} displaytype – The display type of the field. Use constants from JSField for this parameter.  
{Number} x – The x coordinate of the field. If the portal does not have the "multiLine" property set, then the x coordinates are used only for determining the order of the columns in the grid. If the portal has the "multiLine" property set, then the components are actually displayed at the specified coordinates.  
{Number} width – The width of the field.  
{Number} height – The height of the field. In a portal the height of all components is set to the height of the first component, unless the "multiLine" property is set.

**Returns**

**JSField** – A JSField instance that corresponds to the newly created field.

**Sample**

```
var childrenPortal = form.newPortal('pp', 'parent_to_my_table', 10, 10, 1180, 780);

var vlist = solutionModel.newValueList('options', JSValueList.CUSTOM_VALUES);
vlist.customValues = "one\ntwo\nthree\nfour";

var cal = childrenPortal.newField('my_table_date', JSField.CALENDAR, 0, 60, 20);
var chk = childrenPortal.newField('my_table_options', JSField.CHECKS, 60, 60, 50);
chk.valuelist = vlist;
var cmb = childrenPortal.newField('my_table_options', JSField.COMBOBOX, 120, 160, 20);
cmb.valuelist = vlist;
var html = childrenPortal.newField('my_table_html', JSField.HTML_AREA, 180, 60, 50);
var img = childrenPortal.newField('my_table_image', JSField.IMAGE_MEDIA, 240, 60, 50);
var pwd = childrenPortal.newField('my_table_text', JSField.PASSWORD, 300, 60, 20);
var radio = childrenPortal.newField('my_table_options', JSField.RADOS, 360, 60, 50);
radio.valuelist = vlist;
var rtf = childrenPortal.newField('my_table_rtf', JSField.RTF_AREA, 420, 60, 50);
var tarea = childrenPortal.newField('my_table_text', JSField.TEXT_AREA, 480, 60, 50);
var tfield = childrenPortal.newField('my_table_text', JSField.TEXT_FIELD, 540, 60, 20);
var tahead = childrenPortal.newField('my_table_text', JSField.TYPE_AHEAD, 600, 60, 20);
tahead.valuelist = vlist;
```

**newHtmlArea**

**JSField newHtmlArea(dataprovider, x, width, height)**

Creates a new HTML Area field in the portal. It is equivalent to calling "newField" with the type JSField.HTML\_AREA.

**Parameters**

{Object} dataprovider – The data provider for this field. Can be either a column name, or an instance of JSVariable.

{Number} x – The x coordinate of the field. If the portal does not have the "multiLine" property set, then the x coordinates are used only for determining the order of the columns in the grid. If the portal has the "multiLine" property set, then the components are actually displayed at the specified coordinates.

{Number} width – The width of the field.

{Number} height – The height of the field. In a portal the height of all components is set to the height of the first component, unless the "multiLine" property is set.

**Returns**

**JSField** – A JSField instance that corresponds to the newly created HTML Area field.

**Sample**

```
var childrenPortal = form.newPortal('pp', 'parent_to_my_table', 10, 10, 1180, 780);
var html = childrenPortal.newHtmlArea('my_table_html', 180, 60, 50);
```

**newImageMedia**

**JSField newImageMedia(dataprovider, x, width, height)**

Creates a new Image Media field in the portal. It is equivalent to calling "newField" with the type JSField.IMAGE\_MEDIA.

**Parameters**

{Object} dataprovider – The data provider for this field. Can be either a column name, or an instance of JSVariable.

{Number} x – The x coordinate of the field. If the portal does not have the "multiLine" property set, then the x coordinates are used only for determining the order of the columns in the grid. If the portal has the "multiLine" property set, then the components are actually displayed at the specified coordinates.

{Number} width – The width of the field.

{Number} height – The height of the field. In a portal the height of all components is set to the height of the first component, unless the "multiLine" property is set.

**Returns**

**JSField** – A JSField instance that corresponds to the newly created Image Media field.

**Sample**

```
var childrenPortal = form.newPortal('pp', 'parent_to_my_table', 10, 10, 1180, 780);
var img = childrenPortal.newImageMedia('my_table_image', 240, 60, 50);
```

**newLabel**

**JLabel newLabel(txt, x, width, height)**

Creates a new label on the form, with the given text, place and size.

#### Parameters

{String} txt – The text that will be displayed in the label.  
{Number} x – The x coordinate of the label. If the portal does not have the "multiLine" property set, then the x coordinates are used only for determining the order of the columns in the grid. If the portal has the "multiLine" property set, then the components are actually displayed at the specified coordinates.  
{Number} width – The width of the label.  
{Number} height – The height of the label. In a portal the height of all components is set to the height of the first component, unless the "multiLine" property is set.

#### Returns

**JLabel** – A JLabel instance that represents the newly created label.

#### Sample

```
var clickMethod = form.newMethod('function clickMe() { application.output("I was clicked!"); }');
var childrenPortal = form.newPortal('pp', 'parent_to_my_table', 10, 10, 1180, 780);
var callLabel = childrenPortal.newLabel('Date', 120, 60, 20);
// This will result in a button being actually created, because we specify an action.
var textLabel = childrenPortal.newLabel('Text', 180, 60, 20, clickMethod);
```

#### newLabel

**JLabel** **newLabel**(text, x, width, height, action)

Creates a new label on the form, with the given text, place, size and an JSMethod as the onClick action.

#### Parameters

{String} text – The text that will be displayed in the label.  
{Number} x – The x coordinate of the label. If the portal does not have the "multiLine" property set, then the x coordinates are used only for determining the order of the columns in the grid. If the portal has the "multiLine" property set, then the components are actually displayed at the specified coordinates.  
{Number} width – The width of the label.  
{Number} height – The height of the label. In a portal the height of all components is set to the height of the first component, unless the "multiLine" property is set.  
{Object} action – The JSMethod object that should be executed when the label is clicked.

#### Returns

**JLabel** – A JLabel instance that represents the newly created label.

#### Sample

```
var clickMethod = form.newMethod('function clickMe() { application.output("I was clicked!"); }');
var childrenPortal = form.newPortal('pp', 'parent_to_my_table', 10, 10, 1180, 780);
var callLabel = childrenPortal.newLabel('Date', 120, 60, 20);
// This will result in a button being actually created, because we specify an action.
var textLabel = childrenPortal.newLabel('Text', 180, 60, 20, clickMethod);
```

#### newPassword

**JSField** **newPassword**(dataprovider, x, width, height)

Creates a new password field in the portal. It is equivalent to calling "newField" with the type JSField.PASSWORD.

#### Parameters

{Object} dataprovider – The data provider for this field. Can be either a column name, or an instance of JSVariable.  
{Number} x – The x coordinate of the field. If the portal does not have the "multiLine" property set, then the x coordinates are used only for determining the order of the columns in the grid. If the portal has the "multiLine" property set, then the components are actually displayed at the specified coordinates.  
{Number} width – The width of the field.  
{Number} height – The height of the field. In a portal the height of all components is set to the height of the first component, unless the "multiLine" property is set.

#### Returns

**JSField** – A JSField instance that corresponds to the newly created password field.

#### Sample

```
var childrenPortal = form.newPortal('pp', 'parent_to_my_table', 10, 10, 1180, 780);
var pwd = childrenPortal.newPassword('my_table_text', 300, 60, 20);
```

#### newRadios

**JSField** **newRadios**(dataprovider, x, width, height)

Creates a new radio buttons field in the portal. It is equivalent to calling "newField" with the type JSField.RADIOES.

#### Parameters

{Object} dataprovider – The data provider for this field. Can be either a column name, or an instance of JSVariable.  
{Number} x – The x coordinate of the field. If the portal does not have the "multiLine" property set, then the x coordinates are used only for determining the order of the columns in the grid. If the portal has the "multiLine" property set, then the components are actually displayed at the specified coordinates.  
{Number} width – The width of the field.  
{Number} height – The height of the field. In a portal the height of all components is set to the height of the first component, unless the "multiLine" property is set.

**Returns**

**JSField** – A JSField instance that corresponds to the newly created radio buttons.

**Sample**

```
var childrenPortal = form.newPortal('pp', 'parent_to_my_table', 10, 10, 1180, 780);
var vlist = solutionModel.newValueList('options', JSValueList.CUSTOM_VALUES);
vlist.customValues = "one\ntwo\nthree\nfour";
var radio = childrenPortal.newRadios('my_table_options', 360, 60, 50);
radio.valueList = vlist;
```

**newRtfArea**

**JSField newRtfArea(dataprovider, x, width, height)**

Creates a new RTF Area field in the portal. It is equivalent to calling "newField" with the type JSField.RTF\_AREA.

**Parameters**

{Object} dataprovider – The data provider for this field. Can be either a column name, or an instance of JSVariable.

{Number} x – The x coordinate of the field. If the portal does not have the "multiLine" property set, then the x coordinates are used only for determining the order of the columns in the grid. If the portal has the "multiLine" property set, then the components are actually displayed at the specified coordinates.

{Number} width – The width of the field.

{Number} height – The height of the field. In a portal the height of all components is set to the height of the first component, unless the "multiLine" property is set.

**Returns**

**JSField** – A JSField instance that corresponds to the newly created RTF Area field.

**Sample**

```
var childrenPortal = form.newPortal('pp', 'parent_to_my_table', 10, 10, 1180, 780);
var rtf = childrenPortal.newRtfArea('my_table_rtf', 420, 60, 50);
```

**newTextArea**

**JSField newTextArea(dataprovider, x, width, height)**

Creates a new text area field in the portal. It is equivalent to calling "newField" with the type JSField.TEXT\_AREA.

**Parameters**

{Object} dataprovider – The data provider for this field. Can be either a column name, or an instance of JSVariable.

{Number} x – The x coordinate of the field. If the portal does not have the "multiLine" property set, then the x coordinates are used only for determining the order of the columns in the grid. If the portal has the "multiLine" property set, then the components are actually displayed at the specified coordinates.

{Number} width – The width of the field.

{Number} height – The height of the field. In a portal the height of all components is set to the height of the first component, unless the "multiLine" property is set.

**Returns**

**JSField** – A JSField instance that corresponds to the newly created text area field.

**Sample**

```
var childrenPortal = form.newPortal('pp', 'parent_to_my_table', 10, 10, 1180, 780);
var tarea = childrenPortal.newTextArea('my_table_text', 480, 60, 50);
```

**newTextField**

**JSField newTextField(dataprovider, x, width, height)**

Creates a new text field in the portal. It is equivalent to calling "newField" with the type JSField.TEXT\_FIELD.

**Parameters**

{Object} dataprovider – The data provider for this field. Can be either a column name, or an instance of JSVariable.

{Number} x – The x coordinate of the field. If the portal does not have the "multiLine" property set, then the x coordinates are used only for determining the order of the columns in the grid. If the portal has the "multiLine" property set, then the components are actually displayed at the specified coordinates.

{Number} width – The width of the field.

{Number} height – The height of the field. In a portal the height of all components is set to the height of the first component, unless the "multiLine" property is set.

**Returns**

**JSField** – A JSField instance that corresponds to the newly created text field.

**Sample**

```
var childrenPortal = form.newPortal('pp', 'parent_to_my_table', 10, 10, 1180, 780);
var tfield = childrenPortal.newTextField('my_table_text', 540, 60, 20);
```

**newTypeAhead**

**JSField newTypeAhead(dataprovider, x, width, height)**

Creates a new type ahead field in the portal. It is equivalent to calling "newField" with the type JSField.TYPE\_AHEAD.

**Parameters**

{Object} dataprovider – The data provider for this field. Can be either a column name, or an instance of JSVariable.

{Number} x – The x coordinate of the field. If the portal does not have the "multiLine" property set, then the x coordinates are used only for determining the order of the columns in the grid. If the portal has the "multiLine" property set, then the components are actually displayed at the specified coordinates.

{Number} width – The width of the field.

{Number} height – The height of the field. In a portal the height of all components is set to the height of the first component, unless the "multiLine" property is set.

**Returns**

**JSField** – A JSField instance that corresponds to the newly created type ahead field.

**Sample**

```
var childrenPortal = form.newPortal('pp', 'parent_to_my_table', 10, 10, 1180, 780);
var vlist = solutionModel.newValueList('options', JSValueList.CUSTOM_VALUES);
vlist.customValues = "one\ntwo\nthree\nfour";
var tahead = childrenPortal.newTypeAhead('my_table_text', 600, 60, 20);
tahead.valuelist = vlist;
```

**putDesignTimeProperty****Object putDesignTimeProperty()**

Set a design-time property of an element.

**Returns**

**Object**

**Sample**

```
var frm = solutionModel.getForm('orders')
var fld = frm.getField('fld')
fld.putDesignTimeProperty('myprop', 'strawberry')
```

**removeDesignTimeProperty****Object removeDesignTimeProperty()**

Clear a design-time property of an element.

**Returns**

**Object**
