

# Deployment in the Cloud

Servoy can be deployed in most cloud computing environments. Essentially all you need is a database (this can be a third party or the included PostgreSQL database) and the possibility to run a Java process (Java 5 or higher, Java 6 recommended).

Servoy Server can then be installed on the server, either with the GUI installation (if a GUI is available) or command line. It is also possible to copy a directory of Servoy from one server to another. As there are some batch scripts it is recommended to only make copies between similar operating systems. Additionally if the included PostgreSQL database is used the binaries are not cross platform.

To increase availability or performance it is possible to use [Servoy Cluster](#) and combine multiple servers.
