

JSDNDEvent

 Apr 07, 2024 02:12

Supported Clients

SmartClient WebClient NGClient

Constants Summary

| | | |
|--------|----------------|---|
| String | ACTION | Constant returned by JSEvent. |
| String | DATACHANGE | Constant returned by JSEvent. |
| String | DOUBLECLICK | Constant returned by JSEvent. |
| String | FOCUSGAINED | Constant returned by JSEvent. |
| String | FOCUSLOST | Constant returned by JSEvent. |
| String | FORM | Constant returned by JSEvent. |
| Number | MODIFIER_ALT | Constant for the ALT modifier that can be returned by JSDNDEvent. |
| Number | MODIFIER_CTRL | Constant for the CTRL modifier that can be returned by JSDNDEvent. |
| Number | MODIFIER_META | Constant for the META modifier that can be returned by JSDNDEvent. |
| Number | MODIFIER_SHIFT | Constant for the SHIFT modifier that can be returned by JSDNDEvent. |
| String | NONE | Constant returned by JSEvent. |
| String | ONDRA | Constant returned by JSDNDEvent. |
| String | ONDRA | Constant returned by JSDNDEvent. |
| String | ONDRA | Constant returned by JSDNDEvent. |
| String | ONDRO | Constant returned by JSDNDEvent. |
| String | RIGHTCLICK | Constant returned by JSEvent. |

Property Summary

| | | |
|--------|--------------|---|
| Object | data | A data object that specific events can set, a user can set data back to the system for events that supports this. |
| String | dataMimeType | The event data mime type. |

Methods Summary

| | | |
|----------|------------------|--|
| Number | getDragResult() | Returns the result of the drag action. |
| String | getElementName() | returns the name of the element, can be null if the form was the source of the event. |
| String | getFormName() | returns the name of the form the element was placed on. |
| Number | getModifiers() | Returns the modifiers of the event, see JSDNDEvent. |
| String | getName() | Returns the name of the event which was triggered |
| JSRecord | getRecord() | Returns the record of the event. |
| Object | getSource() | returns the source component/element of the event. |
| Date | getTimestamp() | Returns the time the event occurred. |
| String | getType() | returns the dnd event type see the JSDNDEvents constants what it can return. |
| Number | getX() | Returns the x position of the event, relative to the component that fired it, if applicable. |
| Number | getY() | Returns the y position of the event, relative to the component that fired it, if applicable. |

Constants Details

ACTION

Constant returned by JSEvent.getType() in a method that is attached to an onAction event.

Returns

String

Supported Clients

SmartClient,WebClient,NGClient

Sample

```
if (event.getType() == JSEvent.ACTION)
{
    // its an action event.
}
```

DATACHANGE

Constant returned by JSEvent.getType() in a method that is attached to an onDataChange event.

Returns

[String](#)

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
if (event.getType() == JSEvent.DATACHANGE)
{
    // its a data change event
}
```

DOUBLECLICK

Constant returned by JSEvent.getType() in a method that is attached to an onDoubleClick event.

Returns

[String](#)

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
if (event.getType() == JSEvent.DOUBLECLICK)
{
    // its a double click event.
}
```

FOCUSGAINED

Constant returned by JSEvent.getType() in a method that is attached to an onFocusGained or the forms onElementFocusGained event.

Returns

[String](#)

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
if (event.getType() == JSEvent.FOCUSGAINED)
{
    // its a focus gained event.
}
```

FOCUSLOST

Constant returned by JSEvent.getType() in a method that is attached to an onFocusLost or the forms onElementFocusLost event.

Returns

[String](#)

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
if (event.getType() == JSEvent.FOCUSLOST)
{
    // its a focus lost event.
}
```

FORM

Constant returned by JSEvent.getType() in a method that is attached to a form event (like onShow) or command (like onDeleteRecord)

Returns

[String](#)

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
if (event.getType() == JSEvent.FORM)
{
    // its a form event or command
}
```

MODIFIER_ALT

Constant for the ALT modifier that can be returned by JSDNDEvent.getModifiers();

Returns

[Number](#)

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
//test if the SHIFT modifier is used.
if (event.getModifiers() & JSDNDEvent.MODIFIER_SHIFT)
{
    //do shift action
}
```

MODIFIER_CTRL

Constant for the CTRL modifier that can be returned by JSDNDEvent.getModifiers();

Returns

[Number](#)

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
//test if the SHIFT modifier is used.
if (event.getModifiers() & JSDNDEvent.MODIFIER_SHIFT)
{
    //do shift action
}
```

MODIFIER_META

Constant for the META modifier that can be returned by JSDNDEvent.getModifiers();

Returns

[Number](#)

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
//test if the SHIFT modifier is used.
if (event.getModifiers() & JSDNDEvent.MODIFIER_SHIFT)
{
    //do shift action
}
```

MODIFIER_SHIFT

Constant for the SHIFT modifier that can be returned by `JSDNDEvent.getModifiers()`.

Returns[Number](#)**Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
//test if the SHIFT modifier is used.
if (event.getModifiers() & JSDNDEvent.MODIFIER_SHIFT)
{
    //do shift action
}
```

NONE

Constant returned by `JSEvent.getType()` if the event is not used in a known event or command.

Returns[String](#)**Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
if (event.getType() == JSEvent.NONE)
{
    // type is not set.
}
```

ONDRAg

Constant returned by `JSDNDEvent.getType()` in a method that is attached to an onDrag event.

Returns[String](#)**Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
if (event.getType() == JSDNDEvent.ONDRAG)
{
    // its an ondrag event
    if (event.getElementName() == 'todragelement')
        return DRAGNDROP.COPY
}
```

ONDRAGEND

Constant returned by `JSDNDEvent.getType()` in a method that is attached to an onDragEnd event.

Returns[String](#)**Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
if (event.getType() == JSDNDEvent.ONDRAGEND)
{
    // its an on drag end event.
    // return true if the drop has been completed successfully
    return event.isDropSuccess();
}
```

ONDRAgoVER

Constant returned by `JSDNDEvent.getType()` in a method that is attached to an `onDragOver` event.

Returns

`String`

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
if (event.getType() == JSDNDEvent.ONDRAGOVER)
{
    // its an on drag over event.
    // return true if it over the right element.
    return event.getElementName() == 'candroponelement';
}
```

ONDROP

Constant returned by `JSDNDEvent.getType()` in a method that is attached to an `onDrop` event.

Returns

`String`

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
if (event.getType() == JSDNDEvent.ONDROP)
{
    // its a on drop event.
    var element = elements[event.getElementName()];
    // do drop on element
    return true;
}
```

RIGHTCLICK

Constant returned by `JSEvent.getType()` in a method that is attached to an `onRightClick` event.

Returns

`String`

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
if (event.getType() == JSEvent.RIGHTCLICK)
{
    // its a right click event.
}
```

Property Details

data

A data object that specific events can set, a user can set data back to the system for events that supports this.

Returns

`Object`

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
// A client design method that handles ondrag
if (event.getType() == JSEvent.ONDRAG)
{
    // the data is the selected elements array
    var elements = event.data;
    // only start a client design drag when there is 1 element
    if (elements.length == 1)
    {
        return true;
    }
}

// code for a data drag method
event.data = "drag me!";
return DRAGNDROP.COPY;

// code for a data drop method
var data = event.data;
elements[event.getElementName()].setText(data);
return true;
```

dataMimeType

The event data mime type.

Returns

[String](#)

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
// only accept drag if data is a servoy record
function onDragOver(event)
{
    if(event.dataMimeType.indexOf("application/x-servoy-record-object") == 0) return true;
    else return false;
}
```

Methods Details**getDragResult()**

Returns the result of the drag action.

Returns

[Number](#) a DRAGNDROP constant, representing the result of the drag action

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
function onDragEnd(event)
{
    var dragResult = event.getDragResult();
    if(dragResult == DRAGNDROP.NONE)
    {
        // the drag was canceled
    }
    else if(dragResult == DRAGNDROP.COPY)
    {
        // the drag ended with a copy action
    }
    else if(dragResult == DRAGNDROP.MOVE)
    {
        // the drag ended with a move action
    }
}
```

getElementType()

returns the name of the element, can be null if the form was the source of the event.

Returns

[String](#) a String representing the element name.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
if (event.getElementName() == 'myElement')
{
    elements[event.getElementName()].bgcolor = '#ff0000';
}
```

getFormName()

returns the name of the form the element was placed on.

Returns

[String](#) a String representing the form name.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
forms[event.getFormName()].myFormMethod();
```

getModifiers()

Returns the modifiers of the event, see `JSDNDEvent.MODIFIER_XXXX` for the modifiers that can be returned.

Returns

[Number](#) an int which holds the modifiers as a bitset.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
//test if the SHIFT modifier is used.
if (event.getModifiers() & JSDNDEvent.MODIFIER_SHIFT)
{
    //do shift action
}
```

getName()

Returns the name of the event which was triggered

Returns**String** name of event as string**Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
var name = event.getName();
```

getRecord()

Returns the record of the event.

Returns**JSRecord** Record of the event**Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
event.Record();
```

getSource()

returns the source component/element of the event.

If it has a name the getElementName() is the name of this component.

Returns**Object** an Object representing the source of this event.**Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
// cast to runtime text field (change to another kind of type if you know the type)
/** @type {RuntimeTextField} */
var source = event.getSource();
var sourceDataProvider = source.getDataProviderID();
```

getTimestamp()

Returns the time the event occurred.

Returns**Date** a Date when this event happened.**Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
event.getTimestamp();
```

getType()

returns the dnd event type see the JSDNDEvents constants what it can return.

Returns**String** a String representing the type of this event.**Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
if (event.getType() == JSDNDEvent.ONDROP)
{
    // it's a drop
}
```

getX()

Returns the x position of the event, relative to the component that fired it, if applicable.
For example drag'n'drop events will set the x,y positions.

Returns

Number an int representing the X position.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var x = event.getX();
var xPrevious = previousEvent.getX();
var movedXPixels = x -xPrevious;
```

getY()

Returns the y position of the event, relative to the component that fired it, if applicable.
For example drag'n'drop events will set the x,y positions.

Returns

Number an int representing the Y position.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var y = event.getY();
var yPrevious = previousEvent.getY();
var movedYPixels = y -yPrevious;
```
