# Defining User and Group Security

User groups are defined in the **User and group security** project under the **Resources** node in Solution Explorer.

- To manage user groups, double-click the **User and group security** node (or alternatively, right-click and select **Edit users/groups** from the context menu). The User/Group Editor will open in the editor area, with the group information showing on the left box and the user information showing on the right table.
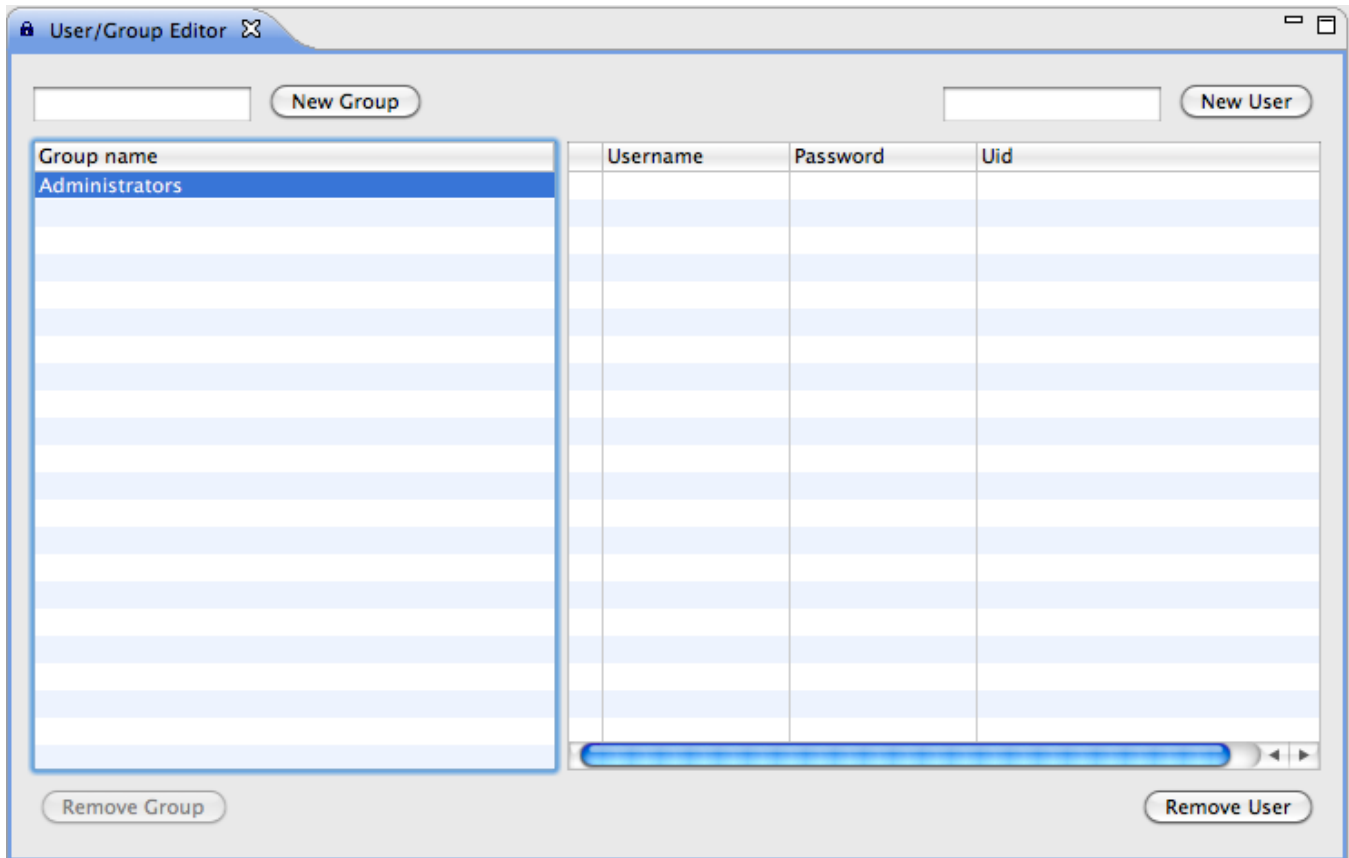

- The Administrators group is a predefined group that comes with the Resources project. To add a new group, enter a new group name in the text box at the upper left corner of the editor and click on **New Group.** The new group will appear on the left column.
- To add a new user to the list, enter the user name in the text box at the upper right corner of the editor and click on **New User.** The new user will appear on the list, where you can enter the desired password. Upon saving the editor, (**CTRL-S** or *cmd-s*) a Uid will be assigned to the new users.
- To add a user to a group, select the desired group name and then check the box next to the user name.
- All changes in this editor must be saved using File>Save or the shortcuts CTRL-S (*cmd-s*).

For more information about setting security properties for a solution, visit the chapter on Managing Security Settings.
