
The manifest.json/header index contributions

From 8.1 the NGClient can have 2 files in its media folder, you can let Servoy generate those files through the context menu on the media node.

manifest.json

The manifest.json file that describes the application to the browser it is a w3c spec: <https://www.w3.org/TR/appmanifest/>

For android you can find an example here: <https://developers.google.com/web/updates/2014/11/Support-for-installable-web-apps-with-webapp-manifest-in-chrome-38-for-Android>

head-index-contributions.html

This is a more generic file where you can include for the NGClient any tag you want to have in the <head> section of the index.html file.

The example that we ship has the same stuff as the manifest file above, but Apple/iOS doesn't support the manifest yet but uses some special meta tags for this: <https://developer.apple.com/library/ios/documentation/AppleApplications/Reference/SafariWebContent/ConfiguringWebApplications/ConfiguringWebApplications.html>

as an example we generate this:

```
<link rel="apple-touch-icon" href="/resources/fs/test_valuelists/bigicon.png">
<link rel="apple-touch-startup-image" href="/resources/fs/test_valuelists/startup.png">
<meta name="apple-mobile-web-app-capable" content="yes">
```
