Favicon support

NGClient generates in the index.html 2 link tags for icons:

```
<link rel="icon" href="favicon32x32.png" sizes="32x32" />
<link rel="icon" href="favicon192x192.png" sizes="192x192" />
```

By default those are the servoy icons, these are places in the webapp root dir, that is in a developer/application_server install:

<install-dir>application_server\server\webapps\ROOT

you can replace the files there with the right sizes. When creating a WAR file for deployement servoy will take those files from that developer installation and include it in the WAR.

For max compatibility also place a favicon.ico file there besides those 2 above. Some browsers will auto look for that one.

As an example Chrome will use the smaller icon for the icon to display in the tab and if you create a (desktop) shortcut it will use the larger one.

NOTE: the files where called favicon75x75.png and favicon200x200.png before 8.1.2
