

JSEvent

Constants Summary

| | |
|--------|---|
| String | ACTION Constant returned by JSEvent. |
| String | DATACHANGE Constant returned by JSEvent. |
| String | DOUBLECLICK Constant returned by JSEvent. |
| String | FOCUSGAINED Constant returned by JSEvent. |
| String | FOCUSLOST Constant returned by JSEvent. |
| String | FORM Constant returned by JSEvent. |
| Number | MODIFIER_ALT Constant for the ALT modifier that can be returned by JSEvent. |
| Number | MODIFIER_CTRL Constant for the CTRL modifier that can be returned by JSEvent. |
| Number | MODIFIER_META Constant for the META modifier that can be returned by JSEvent. |
| Number | MODIFIER_SHIFT Constant for the SHIFT modifier that can be returned by JSEvent. |
| String | NONE Constant returned by JSEvent. |
| String | RIGHTCLICK Constant returned by JSEvent. |

Property Summary

| | |
|--------|--|
| Object | data A data object that specific events can set, a user can set data back to the system for events that supports this. |
|--------|--|

Method Summary

| | |
|--------|--|
| String | getElementType() returns the name of the element, can be null if the form was the source of the event. |
| String | getFormName() returns the name of the form the element was placed on. |
| Number | getModifiers() Returns the modifiers of the event, see JSEvent. |
| Object | getSource() returns the source component/element of the event. |
| Date | getTimestamp() Returns the time the event occurred. |
| String | getType() returns the event type see the JSEvents constants what it can return. |
| Number | getX() Returns the x position of the event, relative to the component that fired it, if applicable. |
| Number | getY() Returns the y position of the event, relative to the component that fired it, if applicable. |

Constants Details

ACTION

Constant returned by JSEvent.getType() in a method that is attached to an onAction event.

Returns

String

Sample

```
if (event.getType() == JSEvent.ACTION)
{
    // its an action event.
}
```

DATACHANGE

Constant returned by JSEvent.getType() in a method that is attached to an onDataChange event.

Returns

[String](#)

Sample

```
if (event.getType() == JSEvent.DATACHANGE)
{
    // its a data change event
}
```

DOUBLECLICK

Constant returned by JSEvent.getType() in a method that is attached to an onDoubleClick event.

Returns

[String](#)

Sample

```
if (event.getType() == JSEvent.DOUBLECLICK)
{
    // its a double click event.
}
```

FOCUSGAINED

Constant returned by JSEvent.getType() in a method that is attached to an onFocusGained or the forms onElementFocusGained event.

Returns

[String](#)

Sample

```
if (event.getType() == JSEvent.FOCUSGAINED)
{
    // its a focus gained event.
}
```

FOCUSLOST

Constant returned by JSEvent.getType() in a method that is attached to an onFocusLost or the forms onElementFocusLost event.

Returns

[String](#)

Sample

```
if (event.getType() == JSEvent.FOCUSLOST)
{
    // its a focus lost event.
}
```

FORM

Constant returned by JSEvent.getType() in a method that is attached to a form event (like onShow) or command (like onDeleteRecord)

Returns[String](#)**Sample**

```
if (event.getType() == JSEvent.FORM)
{
    // its a form event or command
}
```

MODIFIER_ALT

Constant for the ALT modifier that can be returned by JSEvent.getModifiers();

Returns[Number](#)**Sample**

```
//test if the SHIFT modifier is used.
if (event.getModifiers() & JSEvent.MODIFIER_SHIFT)
{
    //do shift action
}
```

MODIFIER_CTRL

Constant for the CTRL modifier that can be returned by JSEvent.getModifiers();

Returns[Number](#)**Sample**

```
//test if the SHIFT modifier is used.
if (event.getModifiers() & JSEvent.MODIFIER_SHIFT)
{
    //do shift action
}
```

MODIFIER_META

Constant for the META modifier that can be returned by JSEvent.getModifiers();

Returns[Number](#)**Sample**

```
//test if the SHIFT modifier is used.
if (event.getModifiers() & JSEvent.MODIFIER_SHIFT)
{
    //do shift action
}
```

MODIFIER_SHIFT

Constant for the SHIFT modifier that can be returned by JSEvent.getModifiers();

Returns[Number](#)

Sample

```
//test if the SHIFT modifier is used.  
if (event.getModifiers() & JSEvent.MODIFIER_SHIFT)  
{  
    //do shift action  
}
```

NONE

Constant returned by JSEvent.getType() if the event is not used in a known event or command.

Returns

[String](#)

Sample

```
if (event.getType() == JSEvent.NONE)  
{  
    // type is not set.  
}
```

RIGHTCLICK

Constant returned by JSEvent.getType() in a method that is attached to an onRightClick event.

Returns

[String](#)

Sample

```
if (event.getType() == JSEvent.RIGHTCLICK)  
{  
    // its a right click event.  
}
```

Property Details

data

A data object that specific events can set, a user can set data back to the system for events that supports this.

Returns

[Object](#)

Sample

```
// A client design method that handles ondrag
if (event.getType() == JSEvent.ONDRAG)
{
    // the data is the selected elements array
    var elements = event.data;
    // only start a client design drag when there is 1 element
    if (elements.length == 1)
    {
        return true;
    }
}

// code for a data drag method
event.data = "drag me!";
return DRAGNDROP.COPY;

// code for a data drop method
var data = event.data;
elements[event.getElementName()].setText(data);
return true;
```

Method Details

getElementName

String **getElementName ()**

returns the name of the element, can be null if the form was the source of the event.

Returns

String - a String representing the element name.

Sample

```
if (event.getElementName() == 'myElement')
{
    elements[event.getElementName()].bgcolor = '#ff0000';
}
```

getFormName

String **getFormName ()**

returns the name of the form the element was placed on.

Returns

String - a String representing the form name.

Sample

```
forms[event.getFormName()].myFormMethod();
```

getModifiers

Number **getModifiers ()**

Returns the modifiers of the event, see JSEvent.MODIFIER_XXXX for the modifiers that can be returned.

Returns

Number - an int which holds the modifiers as a bitset.

Sample

```
//test if the SHIFT modifier is used.  
if (event.getModifiers() & JSEvent.MODIFIER_SHIFT)  
{  
    //do shift action  
}
```

getSource

Object **getSource ()**

returns the source component/element of the event.

If it has a name the getElementName() is the name of this component.

Returns

Object - an Object representing the source of this event.

Sample

```
// cast to runtime text field (change to another kind of type if you know the type)  
/** @type {RuntimeTextField} */  
var source = event.getSource();  
var sourceDataProvider = source.getDataProviderID();
```

getTimestamp

Date **getTimestamp ()**

Returns the time the event occurred.

Returns

Date - a Date when this event happened.

Sample

```
event.getTimestamp();
```

getType

String **getType ()**

returns the event type see the JSEvents constants what it can return.

Plugins can create events with their own types.

Returns

String - a String representing the type of this event.

Sample

```
if (event.getType() == JSEvent.ACTION)  
{  
    // its an action event.  
}
```

getX

Number **getX ()**

Returns the x position of the event, relative to the component that fired it, if applicable.

For example drag'n'drop events will set the x,y positions.

Returns

Number - an int representing the X position.

Sample

```
var x = event.getX();  
var xPrevious = previousEvent.getX();  
var movedXPixels = x - xPrevious;
```

getY

Number **getY ()**

Returns the y position of the event, relative to the component that fired it, if applicable.

For example drag'n'drop events will set the x,y positions.

Returns

Number - an int representing the Y position.

Sample

```
var y = event.getY();
var yPrevious = previousEvent.getY();
var movedYPixels = y -yPrevious;
```
