## Supported Clients

MobileClient

## Property Summary

String	<a href="#">dataProviderID</a>	The dataprovider of the component.
Number	<a href="#">displayType</a>	The type of display used by the field.
Boolean	<a href="#">enabled</a>	The enable state of the component, default true.
String	<a href="#">format</a>	The format that should be applied when displaying the data in the component.
String	<a href="#">name</a>	The name of the component.
JSMETHOD	<a href="#">onAction</a>	The method that is executed when the component is clicked.
JSMETHOD	<a href="#">onDataChange</a>	Method that is executed when the data in the component is successfully changed.
String	<a href="#">styleClass</a>	The name of the style class that should be applied to this component.
Boolean	<a href="#">visible</a>	The visible property of the component, default true.
Number	<a href="#">x</a>	The x coordinate of the component on the form.
Number	<a href="#">y</a>	The y coordinate of the component on the form.

## Property Details

### dataProviderID

The dataprovider of the component.

#### Returns

[String](#)

#### Supported Clients

SmartClient,WebClient,NGClient,MobileClient

#### Sample

```
// Normally the dataprovider is specified when a component is created.
var field = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 40, 100, 20);
// But it can be modified later if needed.
field.dataProviderID = 'parent_table_id';
```

### displayType

The type of display used by the field. Can be one of CALENDAR, CHECKS, COMBOBOX, HTML\_AREA, IMAGE\_MEDIA, PASSWORD, RADIOS, RTF\_AREA, TEXT\_AREA, TEXT\_FIELD, TYPE\_AHEAD, LIST\_BOX, MULTISELECT\_LISTBOX or SPINNER.

#### Returns

[Number](#)

#### Supported Clients

SmartClient,WebClient,NGClient,MobileClient

#### Sample

```
// The display type is specified when the field is created.
var cal = form.newField('my_table_date', JSField.CALENDAR, 10, 10, 100, 20);
// But it can be changed if needed.
cal.dataProviderID = 'my_table_text';
cal.displayType = JSField.TEXT_FIELD;
```

### enabled

The enable state of the component, default true.

#### Returns

[Boolean](#)

#### Supported Clients

SmartClient,WebClient,NGClient,MobileClient

**Sample**

```
var form = solutionModel.newForm('printForm', 'db:/example_data/parent_table', null, false, 400, 300);
var field = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 10, 100, 20);
field.enabled = false;
```

**format**

The format that should be applied when displaying the data in the component.

There are different options for the different dataprovider types that are assigned to this field.

For Integer fields, there is a display and an edit format, using <http://docs.oracle.com/javase/7/docs/api/java/text/DecimalFormat.html> and the max (string) length can be set.

For Text/String fields, there are options to force uppercase, lowercase or only numbers. Or a mask can be set that restrict the input the pattern chars can be found here: <http://docs.oracle.com/javase/7/docs/api/javaw/swing/text/MaskFormatter.html>

A mask can have a placeholder (what is shown when there is no data) and if the data must be stored raw (without literals of the mask). A max text length can also be set to force

the max text length input, this doesn't work on mask because that max length is controlled with the mask.

For Date fields a display and edit format can be set by using a pattern from here: <http://docs.oracle.com/javase/7/docs/api/java/text/SimpleDateFormat.html>, you can also say this must behave like a mask (the edit format)

A mask only works with when the edit format is exactly that mask (1 char is 1 number/char), because for example MM then only 2 numbers are allowed MMM that displays the month as a string is not supported as a mask.

Some examples are "dd-MM-yyyy", "MM-dd-yyyy", etc.

The format property is also used to set the UI Converter, this means that you can convert the value object to something else before it gets set into the field, this can also result in a type change of the data.

So a string in scripting/db is converted to a integer in the ui, then you have to set an integer format.

This property is applicable only for types: TEXT\_FIELD, COMBOBOX, TYPE\_AHEAD, CALENDAR and SPINNER.

**Returns**

[String](#)

**Supported Clients**

SmartClient,WebClient,NGClient,MobileClient

**Sample**

```
var field = form.newField('my_table_number', JSField.TEXT_FIELD, 10, 10, 100, 20);
field.format = '$#.00';
```

**name**

The name of the component. Through this name it can also accessed in methods.

Must be a valid javascript name. (no - in the name or start with number)

**Returns**

[String](#)

**Supported Clients**

SmartClient,WebClient,NGClient,MobileClient

**Sample**

```
var form = solutionModel.newForm('someForm', 'db:/example_data/parent_table', null, false, 620, 300);
var label = form.newLabel('Label', 10, 10, 150, 150);
label.name = 'myLabel'; // Give a name to the component.
forms['someForm'].controller.show()
// Now use the name to access the component.
forms['someForm'].elements['myLabel'].text = 'Updated text';
```

**onAction**

The method that is executed when the component is clicked.

**Returns**

[JSMethod](#)

**Supported Clients**

SmartClient,WebClient,NGClient,MobileClient

**Sample**

```

var doNothingMethod = form.newMethod('function doNothing() { application.output("Doing nothing."); }');
var onClickMethod = form.newMethod('function onClick(event) { application.output("I was clicked at " + event.
getTimestamp()); }');
var onDoubleClickMethod = form.newMethod('function onDoubleClick(event) { application.output("I was double-
clicked at " + event.getTimestamp()); }');
var onRightClickMethod = form.newMethod('function onRightClick(event) { application.output("I was right-clicked
at " + event.getTimestamp()); }');
// At creation the button has the 'doNothing' method as onClick handler, but we'll change that later.
var btn = form.newButton('I am a button', 10, 40, 200, 20, doNothingMethod);
btn.onAction = onClickMethod;
btn.onDoubleClick = onDoubleClickMethod;
btn.onRightClick = onRightClickMethod;

```

**onChange**

Method that is executed when the data in the component is successfully changed.

**Returns**

[JSMethod](#)

**Supported Clients**

SmartClient, WebClient, NGClient, MobileClient

**Sample**

```

var form = solutionModel.newForm('someForm', 'db:/example_data/parent_table', null, false, 620, 300);
var onChangeMethod = form.newMethod('function onChange(oldValue, newValue, event) { application.output
("Data changed from " + oldValue + " to " + newValue + " at " + event.getTimestamp()); }');
var field = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 10, 100, 20);
field.onChange = onChangeMethod;
forms['someForm'].controller.show();

```

**styleClass**

The name of the style class that should be applied to this component.

When defining style classes for specific component types, their names must be prefixed according to the type of the component. For example in order to define a class names 'fancy' for fields, in the style definition the class must be named 'field.fancy'. If it would be intended for labels, then it would be named 'label.fancy'. When specifying the class name for a component, the prefix is dropped however. Thus the field or the label will have its styleClass property set to 'fancy' only.

**Returns**

[String](#)

**Supported Clients**

SmartClient, WebClient, NGClient, MobileClient

**Sample**

```

var form = solutionModel.newForm('printForm', 'db:/example_data/parent_table', null, false, 400, 300);
var field = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 10, 100, 20);
var style = solutionModel.newStyle('myStyle', 'field.fancy { background-color: yellow; }');
form.styleName = 'myStyle'; // First set the style on the form.
field.styleClass = 'fancy'; // Then set the style class on the field.

```

**visible**

The visible property of the component, default true.

**Returns**

[Boolean](#)

**Supported Clients**

SmartClient, WebClient, NGClient, MobileClient

**Sample**

```
var form = solutionModel.newForm('printForm', 'db:/example_data/parent_table', null, false, 400, 300);
var field = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 10, 100, 20);
field.visible = false;
```

**x**

The x coordinate of the component on the form.

**Returns**

[Number](#)

**Supported Clients**

SmartClient,WebClient,NGClient,MobileClient

**Sample**

```
var field = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 10, 100, 20);
application.output('original location: ' + field.x + ', ' + field.y);
field.x = 90;
field.y = 90;
application.output('changed location: ' + field.x + ', ' + field.y);
```

**y**

The y coordinate of the component on the form.

**Returns**

[Number](#)

**Supported Clients**

SmartClient,WebClient,NGClient,MobileClient

**Sample**

```
var field = form.newField('parent_table_text', JSField.TEXT_FIELD, 10, 10, 100, 20);
application.output('original location: ' + field.x + ', ' + field.y);
field.x = 90;
field.y = 90;
application.output('changed location: ' + field.x + ', ' + field.y);
```
