

# JSRelation

For more information see [Relations](#)

## Constants Summary

<code>Number #INNER_JOIN</code>	Constant for set/get the joinType of a JSRelation.
<code>Number #LEFT_OUTER_JOIN</code>	Constant for set/get the joinType of a JSRelation.

## Property Summary

<code>Boolean #allowCreationRelatedRecords</code>	Flag that tells if related records can be created through this relation.
<code>Boolean #allowParentDeleteWhenHavingRelatedRecords</code>	Flag that tells if the parent record can be deleted while it has related records.
<code>Boolean #deleteRelatedRecords</code>	Flag that tells if related records should be deleted or not when a parent record is deleted.
<code>String #foreignDataSource</code>	Qualified name of the foreign data source.
<code>#initialSort</code>	
<code>String A String which specified a set of sort options for the initial sorting of data retrieved through this relation.</code>	
<code>Number #joinType</code>	The join type that is performed between the primary table and the foreign table.
<code>String #name</code>	The name of the relation.
<code>String #primaryDataSource</code>	Qualified name of the primary data source.

## Method Summary

<code>JSRelationItem[] #getRelationItems()</code>	Returns an array of JSRelationItem objects representing the relation criteria defined for this relation.
<code>UUID #getUUID()</code>	Returns the UUID of the relation object
<code>JSRelationItem #newRelationItem(dataprovider, operator, foreinColumnName)</code>	Creates a new relation item for this relation.
<code>void #removeRelationItem(primaryDataProviderID, operator, foreinColumnName)</code>	Removes the desired relation item from the specified relation.

## Constants Details

### INNER\_JOIN

Constant for set/get the joinType of a JSRelation. It is also used in solutionModel.newRelation(...).

#### Returns

#### Number

#### Sample

```
var relation = solutionModel.newRelation('parentToChild', 'example_data', 'parent_table', 'example_data',
'child_table', JSRelation.INNER_JOIN);
relation.joinType = JSRelation.LEFT_OUTER_JOIN;
```

### LEFT\_OUTER\_JOIN

Constant for set/get the joinType of a JSRelation. It is also used in solutionModel.newRelation(...).

#### Returns

#### Number

#### Sample

```
var relation = solutionModel.newRelation('parentToChild', 'example_data', 'parent_table', 'example_data',
'child_table', JSRelation.INNER_JOIN);
relation.joinType = JSRelation.LEFT_OUTER_JOIN;
```

## Property Details

### allowCreationRelatedRecords

Flag that tells if related records can be created through this relation.

The default value of this flag is "false".

#### Returns

#### Boolean

#### Sample

```
var relation = solutionModel.newRelation('parentToChild', 'example_data', 'parent_table', 'example_data',
'child_table', JSRelation.INNER_JOIN);
relation.allowCreationRelatedRecords = true;
```

### allowParentDeleteWhenHavingRelatedRecords

Flag that tells if the parent record can be deleted while it has related records.

The default value of this flag is "true".

#### Returns

#### Boolean

#### Sample

```
var relation = solutionModel.newRelation('parentToChild', 'example_data', 'parent_table', 'example_data',
'child_table', JSRelation.INNER_JOIN);
relation.allowParentDeleteWhenHavingRelatedRecords = false;
```

**deleteRelatedRecords**

Flag that tells if related records should be deleted or not when a parent record is deleted.

The default value of this flag is "false".

**Returns****Boolean****Sample**

```
var relation = solutionModel.newRelation('parentToChild', 'example_data', 'parent_table', 'example_data',
'child_table', JSRelation.INNER_JOIN);
relation.deleteRelatedRecords = true;
```

**foreignDataSource**

Qualified name of the foreign data source. Contains both the name of the foreign server and the name of the foreign table.

**Returns****String****Sample**

```
var relation = solutionModel.newRelation('parentToChild', 'example_data', 'parent_table', 'example_data',
'child_table', JSRelation.INNER_JOIN);
relation.primaryDataSource = 'db:/user_data/another_parent_table';
relation.foreignDataSource = 'db:/user_data/another_child_table';
```

**initialSort**

A String which specified a set of sort options for the initial sorting of data retrieved through this relation.

Has the form "column\_name asc, another\_column\_name desc, ...".

**Returns****String****Sample**

```
var relation = solutionModel.newRelation('parentToChild', 'example_data', 'parent_table', 'example_data',
'child_table', JSRelation.INNER_JOIN);
relation.initialSort = 'another_child_table_text asc';
```

**joinType**

The join type that is performed between the primary table and the foreign table.

Can be "inner join" or "left outer join".

**Returns****Number****Sample**

```
var relation = solutionModel.newRelation('parentToChild', 'example_data', 'parent_table', 'example_data',
'child_table', JSRelation.INNER_JOIN);
relation.joinType = JSRelation.LEFT_OUTER_JOIN;
```

**name**

The name of the relation.

**Returns****String****Sample**

```
var relation = solutionModel.newRelation('parentToChild', 'example_data', 'parent_table', 'example_data',
'child_table', JSRelation.INNER_JOIN);
relation.name = 'anotherName';
var firstTab = tabs.newTab('firstTab', 'Child Form', childForm, relation);
firstTab.relationName = relation.name;
```

#### primaryDataSource

Qualified name of the primary data source. Contains both the name of the primary server and the name of the primary table.

#### Returns

[String](#)

#### Sample

```
var relation = solutionModel.newRelation('parentToChild', 'example_data', 'parent_table', 'example_data',
'child_table', JSRelation.INNER_JOIN);
relation.primaryDataSource = 'db:/user_data/another_parent_table';
relation.foreignDataSource = 'db:/user_data/another_child_table';
```

#### Method Details

##### getRelationItems

###### [JSRelationItem\[\] getRelationItems\(\)](#)

Returns an array of JSRelationItem objects representing the relation criteria defined for this relation.

#### Returns

[JSRelationItem\[\]](#) – An array of JSRelationItem instances representing the relation criteria of this relation.

#### Sample

```
var criteria = relation.getRelationItems();
for (var i=0; i<criteria.length; i++)
{
    var item = criteria[i];
    application.output('relation item no. ' + i);
    application.output('primary column: ' + item.primaryDataProviderID);
    application.output('operator: ' + item.operator);
    application.output('foreign column: ' + item.foreignColumnName);
}
```

#### getUUID

###### [UUID getUUID\(\)](#)

Returns the UUID of the relation object

#### Returns

[UUID](#)

#### Sample

```
var relation = solutionModel.newRelation('parentToChild', 'example_data', 'parent_table', 'example_data',
'child_table', JSRelation.INNER_JOIN);
application.output(relation.getUUID().toString())
```

#### newRelationItem

###### [JSRelationItem newRelationItem\(dataprovider, operator, foreinColumnName\)](#)

Creates a new relation item for this relation. The primary dataprovider, the foreign data provider and one relation operators (like '=' '!= '> '<) must be provided.

#### Parameters

[String](#) dataprovider – The name of the primary dataprovider.

[String](#) operator – The operator used to relate the primary and the foreign dataproviders.

[String](#) foreinColumnName – The name of the foreign dataprovider.

#### Returns

[JSRelationItem](#) – A JSRelationItem instance representing the newly added relation item.

#### Sample

```
var relation = solutionModel.newRelation('parentToChild', 'example_data', 'parent_table', 'example_data',
'child_table', JSRelation.INNER_JOIN);
relation.newRelationItem('another_parent_table_id', '=', 'another_child_table_parent_id');
```

#### removeRelationItem

###### [void removeRelationItem\(primaryDataProviderID, operator, foreinColumnName\)](#)

Removes the desired relation item from the specified relation.

**Parameters**

{String} primaryDataProviderID – the primary data provider (column) name  
{String} operator – the operator  
{String} foreignColumnName – the foreign column name

**Returns**

void

**Sample**

```
var relation = solutionModel.newRelation('myRelation', 'myServer', 'parentTable', 'myServer', 'childTable',  
JSRelation.INNER_JOIN);  
relation.newRelationItem('someColumn1', '=', 'someColumn2');  
relation.newRelationItem('anotherColumn', '=', 'someOtherColumn');  
relation.removeRelationItem('someColumn1', '=', 'someColumn2');  
var criteria = relation.getRelationItems();  
for (var i = 0; i < criteria.length; i++) {  
    var item = criteria[i];  
    application.output('primary column: ' + item.primaryDataProviderID);  
    application.output('operator: ' + item.operator);  
    application.output('foreign column: ' + item.foreignColumnName);  
}
```
