

Security

Return Types

Constants Summary

Number	<code>#ACCESSIBLE</code>	Constant representing the accessible flag for form security.
Number	<code>#DELETE</code>	Constant representing the delete flag for table security.
Number	<code>#INSERT</code>	Constant representing the insert flag for table security.
Number	<code>#READ</code>	Constant representing the read flag for table security.
Number	<code>#TRACKING</code>	Constant representing the tracking flag for table security.
Number	<code>#UPDATE</code>	Constant representing the update flag for table security.
Number	<code>#VIEWABLE</code>	Constant representing the viewable flag for form security.

Method Summary

Boolean	<code>#addUserToGroup(a_userUID, groupName)</code> Adds an user to a named group.
Object	<code>#authenticate(authenticator_solution, method)</code> Authenticate to the Servoy Server using one of the installed authenticators or the Servoy default authenticator.
Object	<code>#authenticate(authenticator_solution, method, credentials)</code> Authenticate to the Servoy Server using one of the installed authenticators or the Servoy default authenticator.
Boolean	<code>#canDelete(dataSource)</code> Returns a boolean value for security rights.
Boolean	<code>#canInsert(dataSource)</code> Returns a boolean value for security rights.
Boolean	<code>#canRead(dataSource)</code> Returns a boolean value for security rights.
Boolean	<code>#canUpdate(dataSource)</code> Returns a boolean value for security rights.
Boolean	<code>#changeGroupName(oldGroupName, newGroupName)</code> Changes the groupname of a group.
Boolean	<code>#changeUserName(a_userUID, username)</code> Changes the username of the specified userUID.
Boolean	<code>#checkPassword(a_userUID, password)</code> Returns true if the password for that userUID is correct, else false.
String	<code>#createGroup(groupName)</code> Creates a group, returns the groupname (or null when group couldn't be created).
Object	<code>#createUser(username, password, [userUID])</code> Creates a new user, returns new uid (or null when group couldn't be created or user already exist).
Boolean	<code>#deleteGroup(groupName)</code> Deletes a group, returns true if no error was reported.
Boolean	<code>#deleteUser(userUID)</code> Deletes an user.
String	<code>#getClientID()</code> Returns the client ID.
JSDataSet	<code>#getElementUUIDs(formname)</code> Returns the form elements UUID's as dataset, the one with no name is the form itself.
JSDataSet	<code>#getGroups()</code> Get all the groups (returns a dataset).
String	<code>#getSystemUserName()</code> Retrieves the username of the currently logged in user on operating system level.
JSDataSet	<code>#getUserGroups()</code> Get all the groups of the current user.
JSDataSet	<code>#getUserGroups(userUID)</code> Get all the groups for given user UID.
String	<code>#getUserName([userUID])</code> Get the current user name (null if not logged in), finds the user name for given user UID if passed as parameter.
String	<code>#getUserID([username])</code> Get the current user UID (null if not logged in), finds the userUID for given user_name if passed as parameter.
JSDataSet	<code>#getUsers([groupName])</code> Get all the users in the security settings (returns a dataset).
Boolean	<code>#isUserMemberOfGroup(groupName)</code> Check whatever the current user is part of the specified group
Boolean	<code>#isUserMemberOfGroup(groupName, userUID)</code> Check whatever the user specified as parameter is part of the specified group.
Boolean	<code>#login(display_username, a_userUID, groups)</code> Login to be able to leave the solution loginForm.
void	<code>#logout([solutionToLoad], [method], [argument])</code> Logout the current user and close the solution, if the solution requires authentication and user is logged in.
Boolean	<code>#removeUserFromGroup(a_userUID, groupName)</code> Removes an user from a group.
Boolean	<code>#setPassword(a_userUID, password)</code> Set a new password for the given userUID.
void	<code>#setSecuritySettings(dataset)</code> Sets the security settings; the entries contained in the given dataset will override those contained in the current security settings.
Boolean	<code>#setUserID(a_userUID, newUserUID)</code> Set a new userUID for the given userUID.

Constants Details

ACCESSIBLE

Constant representing the accessible flag for form security.

Returns

Number

Sample

```
var colNames = new Array();
colNames[0] = 'uuid';
colNames[1] = 'flags';
var dataset = databaseManager.createEmptyDataSet(0,colNames);

var row = new Array();
row[0] = '413a4d69-becb-4ae4-8fdd-980755d6a7fb';//normally retreived via security.getElementUUIDs(...)
row[1] = JSSecurity.VIEWABLE|JSSecurity.ACCESSIBLE; // use bitwise 'or' for both
dataset.addRow(row);//setting element security

row = new Array();
row[0] = 'example_data.orders';
row[1] = JSSecurity.READ|JSSecurity.INSERT|JSSecurity.UPDATE|JSSecurity.DELETE|JSSecurity.TRACKING; //use
bitwise 'or' for multiple flags
dataset.addRow(row);//setting table security

security.setSecuritySettings(dataset);//to be called in solution startup method
```

DELETE

Constant representing the delete flag for table security.

Returns

Number

Sample

```
var colNames = new Array();
colNames[0] = 'uuid';
colNames[1] = 'flags';
var dataset = databaseManager.createEmptyDataSet(0,colNames);

var row = new Array();
row[0] = '413a4d69-becb-4ae4-8fdd-980755d6a7fb';//normally retreived via security.getElementUUIDs(...)
row[1] = JSSecurity.VIEWABLE|JSSecurity.ACCESSIBLE; // use bitwise 'or' for both
dataset.addRow(row);//setting element security

row = new Array();
row[0] = 'example_data.orders';
row[1] = JSSecurity.READ|JSSecurity.INSERT|JSSecurity.UPDATE|JSSecurity.DELETE|JSSecurity.TRACKING; //use
bitwise 'or' for multiple flags
dataset.addRow(row);//setting table security

security.setSecuritySettings(dataset);//to be called in solution startup method
```

INSERT

Constant representing the insert flag for table security.

Returns

Number

Sample

```
var colNames = new Array();
colNames[0] = 'uuid';
colNames[1] = 'flags';
var dataset = databaseManager.createEmptyDataSet(0,colNames);

var row = new Array();
row[0] = '413a4d69-becb-4ae4-8fdd-980755d6a7fb';//normally retreived via security.getElementUUIDs(...)
row[1] = JSSecurity.VIEWABLE|JSSecurity.ACCESSIBLE; // use bitwise 'or' for both
dataset.addRow(row);//setting element security

row = new Array();
row[0] = 'example_data.orders';
row[1] = JSSecurity.READ|JSSecurity.INSERT|JSSecurity.UPDATE|JSSecurity.DELETE|JSSecurity.TRACKING; //use
bitwise 'or' for multiple flags
dataset.addRow(row);//setting table security

security.setSecuritySettings(dataset);//to be called in solution startup method
```

READ

Constant representing the read flag for table security.

Returns

Number

Sample

```
var colNames = new Array();
colNames[0] = 'uuid';
colNames[1] = 'flags';
var dataset = databaseManager.createEmptyDataSet(0,colNames);

var row = new Array();
row[0] = '413a4d69-becb-4ae4-8fdd-980755d6a7fb';//normally retreived via security.getElementUUIDs(...)
row[1] = JSSecurity.VIEWABLE|JSSecurity.ACCESSIBLE; // use bitwise 'or' for both
dataset.addRow(row);//setting element security

row = new Array();
row[0] = 'example_data.orders';
row[1] = JSSecurity.READ|JSSecurity.INSERT|JSSecurity.UPDATE|JSSecurity.DELETE|JSSecurity.TRACKING; //use
bitwise 'or' for multiple flags
dataset.addRow(row);//setting table security

security.setSecuritySettings(dataset);//to be called in solution startup method
```

TRACKING

Constant representing the tracking flag for table security.

Returns

Number

Sample

```
var colNames = new Array();
colNames[0] = 'uuid';
colNames[1] = 'flags';
var dataset = databaseManager.createEmptyDataSet(0,colNames);

var row = new Array();
row[0] = '413a4d69-becb-4ae4-8fdd-980755d6a7fb';//normally retreived via security.getElementUUIDs(...)
row[1] = JSSecurity.VIEWABLE|JSSecurity.ACCESSIBLE; // use bitwise 'or' for both
dataset.addRow(row);//setting element security

row = new Array();
row[0] = 'example_data.orders';
row[1] = JSSecurity.READ|JSSecurity.INSERT|JSSecurity.UPDATE|JSSecurity.DELETE|JSSecurity.TRACKING; //use
bitwise 'or' for multiple flags
dataset.addRow(row);//setting table security

security.setSecuritySettings(dataset);//to be called in solution startup method
```

UPDATE

Constant representing the update flag for table security.

Returns

Number

Sample

```
var colNames = new Array();
colNames[0] = 'uuid';
colNames[1] = 'flags';
var dataset = databaseManager.createEmptyDataSet(0,colNames);

var row = new Array();
row[0] = '413a4d69-becb-4ae4-8fdd-980755d6a7fb';//normally retreived via security.getElementUUIDs(...)
row[1] = JSSecurity.VIEWABLE|JSSecurity.ACCESSIBLE; // use bitwise 'or' for both
dataset.addRow(row);//setting element security

row = new Array();
row[0] = 'example_data.orders';
row[1] = JSSecurity.READ|JSSecurity.INSERT|JSSecurity.UPDATE|JSSecurity.DELETE|JSSecurity.TRACKING; //use
bitwise 'or' for multiple flags
dataset.addRow(row);//setting table security

security.setSecuritySettings(dataset);//to be called in solution startup method
```

VIEWABLE

Constant representing the viewable flag for form security.

Returns

Number

Sample

```

var colNames = new Array();
colNames[0] = 'uuid';
colNames[1] = 'flags';
var dataset = databaseManager.createEmptyDataSet(0,colNames);

var row = new Array();
row[0] = '413a4d69-becb-4ae4-8fdd-980755d6a7fb';//normally retreived via security.getElementUUIDs(...)
row[1] = JSSecurity.VIEWABLE|JSSecurity.ACCESSIBLE; // use bitwise 'or' for both
dataset.addRow(row);//setting element security

row = new Array();
row[0] = 'example_data.orders';
row[1] = JSSecurity.READ|JSSecurity.INSERT|JSSecurity.UPDATE|JSSecurity.DELETE|JSSecurity.TRACKING; //use
bitwise 'or' for multiple flags
dataset.addRow(row);//setting table security

security.setSecuritySettings(dataset); //to be called in solution startup method

```

Method Details

addUserToGroup

Boolean addUserToGroup(a_userUID, groupName)

Adds an user to a named group.

Parameters

{Object} a_userUID – the user UID to be added

{Object} groupName – the group to add to

Returns

Boolean – true if added

Sample

```

var userUID = security.getUserUID();
security.addUserToGroup(userUID, 'groupname');

```

authenticate

Object authenticate(authenticator_solution, method)

Authenticate to the Servoy Server using one of the installed authenticators or the Servoy default authenticator.

Note: this method should be called from a login solution.

Parameters

{String} authenticator_solution – authenticator solution installed on the Servoy Server, null for servoy built-in authentication

{String} method – authenticator method, null for servoy built-in authentication

Returns

Object – authentication result from authenticator solution or boolean in case of servoy built-in authentication

Sample

```

// create the credentials object as expected by the authenticator solution
var ok = security.authenticate('myldap_authenticator', 'login', [globals.userName, globals.passWord])
if (!ok)
{
    plugins.dialogs.showErrorDialog('Login failed', 'OK')
}

// if no authenticator name is used, the credentials are checked using the Servoy built-in user management
ok = security.authenticate(null, null, [globals.userName, globals.passWord])

```

authenticate

Object authenticate(authenticator_solution, method, credentials)

Authenticate to the Servoy Server using one of the installed authenticators or the Servoy default authenticator.

Note: this method should be called from a login solution, once logged in, the authenticate method has no effect.

Parameters

{String} authenticator_solution – authenticator solution installed on the Servoy Server, null for servoy built-in authentication

{String} method – authenticator method, null for servoy built-in authentication

{Object[]} credentials – array whose elements are passed as arguments to the authenticator method, in case of servoy built-in authentication this should be [username, password]

Returns

Object – authentication result from authenticator solution or boolean in case of servoy built-in authentication

Sample

```
// create the credentials object as expected by the authenticator solution
var ok = security.authenticate('myldap_authenticator', 'login', [globals.userName, globals.passWord])
if (!ok)
{
    plugins.dialogs.showErrorDialog('Login failed', 'OK')
}

// if no authenticator name is used, the credentials are checked using the Servoy built-in user management
ok = security.authenticate(null, null, [globals.userName, globals.passWord])
```

canDelete

Boolean canDelete(dataSource)

Returns a boolean value for security rights.

Parameters

{String} dataSource – the datasource

Returns

Boolean – true if allowed

Sample

```
var dataSource = controller.getDataSource();
var canDelete = security.canDelete(dataSource);
var canInsert = security.canInsert(dataSource);
var canUpdate = security.canUpdate(dataSource);
var canRead = security.canRead(dataSource);
application.output("Can delete? " + canDelete);
application.output("Can insert? " + canInsert);
application.output("Can update? " + canUpdate);
application.output("Can read? " + canRead);
```

canInsert

Boolean canInsert(dataSource)

Returns a boolean value for security rights.

Parameters

{String} dataSource – the datasource

Returns

Boolean – true if allowed

Sample

```
var dataSource = controller.getDataSource();
var canDelete = security.canDelete(dataSource);
var canInsert = security.canInsert(dataSource);
var canUpdate = security.canUpdate(dataSource);
var canRead = security.canRead(dataSource);
application.output("Can delete? " + canDelete);
application.output("Can insert? " + canInsert);
application.output("Can update? " + canUpdate);
application.output("Can read? " + canRead);
```

canRead

Boolean canRead(dataSource)

Returns a boolean value for security rights.

Parameters

{String} dataSource – the datasource

Returns

Boolean – true if allowed

Sample

```
var dataSource = controller.getDataSource();
var canDelete = security.canDelete(dataSource);
var canInsert = security.canInsert(dataSource);
var canUpdate = security.canUpdate(dataSource);
var canRead = security.canRead(dataSource);
application.output("Can delete? " + canDelete);
application.output("Can insert? " + canInsert);
application.output("Can update? " + canUpdate);
application.output("Can read? " + canRead);
```

canUpdate

Boolean canUpdate(dataSource)

Returns a boolean value for security rights.

Parameters

{**String**} dataSource – the datasource

Returns

Boolean – true if allowed

Sample

```
var dataSource = controller.getDataSource();
var canDelete = security.canDelete(dataSource);
var canInsert = security.canInsert(dataSource);
var canUpdate = security.canUpdate(dataSource);
var canRead = security.canRead(dataSource);
application.output("Can delete? " + canDelete);
application.output("Can insert? " + canInsert);
application.output("Can update? " + canUpdate);
application.output("Can read? " + canRead);
```

changeGroupName

Boolean changeGroupName(oldGroupName, newGroupName)

Changes the groupname of a group.

Parameters

{**Object**} oldGroupName – the old name

{**String**} newGroupName – the new name

Returns

Boolean – true if changed

Sample

```
security.changeGroupName('oldGroup', 'newGroup');
```

changeUserName

Boolean changeUserName(a_userUID, username)

Changes the username of the specified userUID.

Parameters

{**Object**} a_userUID – the userUID to work on

{**String**} username – the new username

Returns

Boolean – true if changed

Sample

```
if(security.changeUserName(security.getUserUID('name1'), 'name2'))
{
    application.output('Username changed');
}
```

checkPassword

Boolean checkPassword(a_userUID, password)

Returns true if the password for that userUID is correct, else false.

Parameters

{Object} a_userUID – the userUID to check the password for
{String} password – the new password

Returns

Boolean – true if password oke

Sample

```
if(security.checkPassword(security.getUserUID(), 'password1'))
{
    security.setPassword(security.getUserUID(), 'password2')
}
else
{
    application.output('wrong password')
}
```

createGroup

String **createGroup**(groupName)

Creates a group, returns the groupname (or null when group couldn't be created).

Parameters

{String} groupName – the group name to create

Returns

String – the created groupname

Sample

```
var removeUser = true;
//create a user
var uid = security.createUser('myusername', 'mypassword');
if (uid) //test if user was created
{
    // Get all the groups
    var set = security.getGroups();
    for(var p = 1 ; p <= set.getMaxRowIndex() ; p++)
    {
        // output name of the group
        application.output(set.getValue(p, 2));
        // add user to group
        security.addUserToGroup(uid, set.getValue(p,2));
    }
    // if not remove user, remove user from all the groups
    if(!removeUser)
    {
        // get now all the groups that that users has (all if above did go well)
        var set =security.getUserGroups(uid);
        for(var p = 1;p<=set.getMaxRowIndex();p++)
        {
            // output name of the group
            application.output(set.getValue(p, 2));
            // remove the user from the group
            security.removeUserFromGroup(uid, set.getValue(p,2));
        }
    }
    else
    {
        // delete the user (the user will be removed from the groups)
        security.deleteUser(uid);
    }
}
```

createUser

Object **createUser**(username, password, [userUID])

Creates a new user, returns new uid (or null when group couldn't be created or user already exist).

Parameters

username – the username

password – the user password

[userUID] – the userUID to use

Returns

Object – the userUID the created userUID, will be same if provided

Sample

```
var removeUser = true;
//create a user
var uid = security.createUser('myusername', 'mypassword');
if (uid) //test if user was created
{
    // Get all the groups
    var set = security.getGroups();
    for(var p = 1 ; p <= set.getMaxRowIndex() ; p++)
    {
        // output name of the group
        application.output(set.getValue(p, 2));
        // add user to group
        security.addUserToGroup(uid, set.getValue(p,2));
    }
    // if not remove user, remove user from all the groups
    if(!removeUser)
    {
        // get now all the groups that that users has (all if above did go well)
        var set =security.getUserGroups(uid);
        for(var p = 1;p<=set.getMaxRowIndex();p++)
        {
            // output name of the group
            application.output(set.getValue(p, 2));
            // remove the user from the group
            security.removeUserFromGroup(uid, set.getValue(p,2));
        }
    }
    else
    {
        // delete the user (the user will be removed from the groups)
        security.deleteUser(uid);
    }
}
```

deleteGroup

Boolean **deleteGroup**(groupName)

Deletes a group, returns true if no error was reported.

Parameters

{**Object**} groupName – the name of the group to delete

Returns

Boolean – true if deleted

Sample

```
var removeUser = true;
//create a user
var uid = security.createUser('myusername', 'mypassword');
if (uid) //test if user was created
{
    // Get all the groups
    var set = security.getGroups();
    for(var p = 1 ; p <= set.getMaxRowIndex() ; p++)
    {
        // output name of the group
        application.output(set.getValue(p, 2));
        // add user to group
        security.addUserToGroup(uid, set.getValue(p,2));
    }
    // if not remove user, remove user from all the groups
    if(!removeUser)
    {
        // get now all the groups that that users has (all if above did go well)
        var set =security.getUserGroups(uid);
        for(var p = 1;p<=set.getMaxRowIndex();p++)
        {
            // output name of the group
            application.output(set.getValue(p, 2));
            // remove the user from the group
            security.removeUserFromGroup(uid, set.getValue(p,2));
        }
    }
    else
    {
        // delete the user (the user will be removed from the groups)
        security.deleteUser(uid);
    }
}
```

deleteUser

Boolean **deleteUser**(userUID)

Deletes an user. returns true if no error was reported.

Parameters

{Object} userUID – The UID of the user to be deleted.

Returns

Boolean – true if the user is successfully deleted.

Sample

```
var removeUser = true;
//create a user
var uid = security.createUser('myusername', 'mypassword');
if (uid) //test if user was created
{
    // Get all the groups
    var set = security.getGroups();
    for(var p = 1 ; p <= set.getMaxRowIndex() ; p++)
    {
        // output name of the group
        application.output(set.getValue(p, 2));
        // add user to group
        security.addUserToGroup(uid, set.getValue(p,2));
    }
    // if not remove user, remove user from all the groups
    if(!removeUser)
    {
        // get now all the groups that that users has (all if above did go well)
        var set =security.getUserGroups(uid);
        for(var p = 1;p<=set.getMaxRowIndex();p++)
        {
            // output name of the group
            application.output(set.getValue(p, 2));
            // remove the user from the group
            security.removeUserFromGroup(uid, set.getValue(p,2));
        }
    }
    else
    {
        // delete the user (the user will be removed from the groups)
        security.deleteUser(uid);
    }
}
```

getClientID

String getClientID()

Returns the client ID.

Returns

String – the clientId as seen on the server admin page

Sample

```
var clientId = security.getClientID()
```

getElementUUIDs

JSDataset getElementUUIDs(formname)

Returns the form elements UUID's as dataset, the one with no name is the form itself.

Parameters

{String} formname – the formname to retrieve the dataset for

Returns

JSDataset – dataset with element info

Sample

```
var formElementsUUIDDataSet = security.getElementUUIDs('orders_form');
```

getGroups

JSDataset getGroups()

Get all the groups (returns a dataset).

first id column is deprecated!, use only the group name column.

Returns

JSDataset – dataset with all the groups

Sample

```
var removeUser = true;
//create a user
var uid = security.createUser('myusername', 'mypassword');
if (uid) //test if user was created
{
    // Get all the groups
    var set = security.getGroups();
    for(var p = 1 ; p <= set.getMaxRowIndex() ; p++)
    {
        // output name of the group
        application.output(set.getValue(p, 2));
        // add user to group
        security.addUserToGroup(uid, set.getValue(p,2));
    }
    // if not remove user, remove user from all the groups
    if(!removeUser)
    {
        // get now all the groups that that users has (all if above did go well)
        var set =security.getUserGroups(uid);
        for(var p = 1;p<=set.getMaxRowIndex();p++)
        {
            // output name of the group
            application.output(set.getValue(p, 2));
            // remove the user from the group
            security.removeUserFromGroup(uid, set.getValue(p,2));
        }
    }
    else
    {
        // delete the user (the user will be removed from the groups)
        security.deleteUser(uid);
    }
}
```

getSystemUserName

String getSystemUserName()

Retrieves the username of the currently logged in user on operating system level.

Returns

String – the os user name

Sample

```
//gets the current os username
var osUserName = security.getSystemUserName();
```

getUserGroups

JSDataSet getUserGroups()

Get all the groups of the current user.

Returns

JSDataSet – dataset with groupnames

Sample

```
//get all the users in the security settings (Returns a JSDataSet)
var dsUsers = security.getUsers()

//loop through each user to get their group
//The getValue call is (row,column) where column 1 == id and 2 == name
for(var i=1 ; i<=dsUsers.getMaxRowIndex() ; i++)
{
    //print to the output debugger tab: "user: " and the username
    application.output("user:" + dsUsers.getValue(i,2));

    //set p to the user group for the current user
    var p = security.getUserGroups(dsUsers.getValue(i,1));

    for(k=1;k<=p.getMaxRowIndex();k++)
    {
        //print to the output debugger tab: "group" and the group(s)
        //the user belongs to
        application.output("group: " + p.getValue(k,2));
    }
}
```

getUserGroups

JSDataSet **getUserGroups**(userUID)

Get all the groups for given user UID.

Parameters

{Object} userUID – to retrieve the user groups

Returns

JSDataSet – dataset with groupnames

Sample

```
//get all the users in the security settings (Returns a JSDataSet)
var dsUsers = security.getUsers()

//loop through each user to get their group
//The getValue call is (row,column) where column 1 == id and 2 == name
for(var i=1 ; i<=dsUsers.getMaxRowIndex() ; i++)
{
    //print to the output debugger tab: "user: " and the username
    application.output("user:" + dsUsers.getValue(i,2));

    //set p to the user group for the current user
    var p = security.getUserGroups(dsUsers.getValue(i,1));

    for(k=1;k<=p.getMaxRowIndex();k++)
    {
        //print to the output debugger tab: "group" and the group(s)
        //the user belongs to
        application.output("group: " + p.getValue(k,2));
    }
}
```

getUserName

String **getUserName**([userUID])

Get the current user name (null if not logged in), finds the user name for given user UID if passed as parameter.

Parameters

[userUID] – to retrieve the name

Returns

String – the user name

Sample

```
//gets the current loggedIn username
var userName = security.getUserName();
```

getUserUID

String **getUserUID**([username])

Get the current user UID (null if not logged in), finds the userUID for given user_name if passed as parameter.

Parameters

[username] – the username to find the userUID for

Returns

String – the userUID

Sample

```
//gets the current loggedIn username
var userName = security.getUserName();
//gets the uid of the given username
var userUID = security.getUserUID(userName);
//is the same as above
//var my_userUID = security.getUserUID();
```

getUsers

JSDataset **getUsers**([groupName])

Get all the users in the security settings (returns a dataset).

Parameters

[groupName] – the group to filter on

Returns

JSDataset – dataset with all the users

Sample

```
//get all the users in the security settings (Returns a JSDataset)
var dsUsers = security.getUsers()

//loop through each user to get their group
//The getValue call is (row,column) where column 1 == id and 2 == name
for(var i=1 ; i<=dsUsers.getMaxRowIndex() ; i++)
{
    //print to the output debugger tab: "user: " and the username
    application.output("user:" + dsUsers.getValue(i,2));

    //set p to the user group for the current user
    var p = security.getUserGroups(dsUsers.getValue(i,1));

    for(k=1;k<=p.getMaxRowIndex();k++)
    {
        //print to the output debugger tab: "group" and the group(s)
        //the user belongs to
        application.output("group: " + p.getValue(k,2));
    }
}
```

isUserMemberOfGroup

Boolean **isUserMemberOfGroup**(groupName)

Check whatever the current user is part of the specified group

Parameters

{**String**} groupName – name of the group to check

Returns

Boolean – dataset with groupnames

Sample

```
//check whatever user is part of the Administrators group
if(security.isUserMemberOfGroup('Administrators', security.getUserUID('admin')))
{
    // do administration stuff
}
```

isUserMemberOfGroup

Boolean **isUserMemberOfGroup**(groupName, userUID)

Check whatever the user specified as parameter is part of the specified group.

Parameters

{[String](#)} groupName – name of the group to check
 {[Object](#)} userUID – UID of the user to check

Returns

[Boolean](#) – dataset with groupnames

Sample

```
//check whatever user is part of the Administrators group
if(security.isUserMemberOfGroup('Administrators', security.getUserUID('admin')))
{
    // do administration stuff
}
```

login

[Boolean](#) **login**(display_username, a_userUID, groups)

Login to be able to leave the solution loginForm.

Example: Group names may be received from LDAP (Lightweight Directory Access Protocol) - a standard protocol used in web browsers and email applications to enable lookup queries that access a directory listing.

Parameters

{[String](#)} display_username – the user display name, like 'James Webb'
 {[Object](#)} a_userUID – the user UID to process login for
 {[String](#)[]}} groups – the groups array

Returns

[Boolean](#) – true if loggedin

Sample

```
var groups = new Array()
groups[0] = 'Administrators'; //normally these groups are for example received from LDAP
var user_uid = globals.email; //also this uid might be received from external authentication method
var ok = security.login(globals.username, user_uid , groups)
if (!ok)
{
    plugins.dialogs.showErrorDialog('Login failure', 'Already logged in? or no user_uid/groups specified?', 'OK')
}
```

logout

[void](#) **logout**([solutionToLoad], [method], [argument])

Logout the current user and close the solution, if the solution requires authentication and user is logged in.

You can redirect to another solution if needed; if you want to go to a different url, you need to call application.showURL(url) before calling security.logout() (this is only applicable for Web Client).

An alternative option to close a solution and to open another solution, while keeping the user logged in, is application.closeSolution().

Parameters

[solutionToLoad] – the solution to load after logout
 [method] – the method to run in the solution to load
 [argument] – the argument to pass to the method to run

Returns

[void](#)

Sample

```
//Set the url to go to after logout.
//application.showURL('http://www.servoy.com', '_self'); //Web Client only
security.logout();
    //security.logout('solution_name');//log out and close current solution and open solution
'solution_name'
    //security.logout('solution_name','global_method_name','my_argument');//log out, close current
solution, open solution 'solution_name', call global method 'global_method_name' with argument 'my_argument'
    //Note: specifying a solution will not work in the Developer due to debugger dependencies
    //specified solution should be of compatible type with client (normal type or client specific(Smart client only
/Web client only) type )
```

removeUserFromGroup

[Boolean](#) **removeUserFromGroup**(a_userUID, groupName)

Removes an user from a group.

Parameters

{Object} a_userUID – the user UID to be removed
 {Object} groupName – the group to remove from

Returns

Boolean – true if removed

Sample

```
var removeUser = true;
//create a user
var uid = security.createUser('myusername', 'mypassword');
if (uid) //test if user was created
{
    // Get all the groups
    var set = security.getGroups();
    for(var p = 1 ; p <= set.getMaxRowIndex() ; p++)
    {
        // output name of the group
        application.output(set.getValue(p, 2));
        // add user to group
        security.addUserToGroup(uid, set.getValue(p,2));
    }
    // if not remove user, remove user from all the groups
    if(!removeUser)
    {
        // get now all the groups that that users has (all if above did go well)
        var set =security.getUserGroups(uid);
        for(var p = 1;p<=set.getMaxRowIndex();p++)
        {
            // output name of the group
            application.output(set.getValue(p, 2));
            // remove the user from the group
            security.removeUserFromGroup(uid, set.getValue(p,2));
        }
    }
    else
    {
        // delete the user (the user will be removed from the groups)
        security.deleteUser(uid);
    }
}
```

setPassword

Boolean **setPassword**(a_userUID, password)

Set a new password for the given userUID.

Parameters

{Object} a_userUID – the userUID to set the new password for
 {String} password – the new password

Returns

Boolean – true if changed

Sample

```
if(security.checkPassword(security.getUserUID(), 'password1'))
{
    security.setPassword(security.getUserUID(), 'password2')
}
else
{
    application.output('wrong password')
}
```

setSecuritySettings

void **setSecuritySettings**(dataset)

Sets the security settings; the entries contained in the given dataset will override those contained in the current security settings.

NOTE: The security.getElementUUIDs and security.setSecuritySettings functions can be used to define custom security that overrides Servoy security.
 For additional information see the function security.getElementUUIDs.

Parameters

{Object} dataset – the dataset with security settings

Returns

void

Sample

```

var colNames = new Array();
colNames[0] = 'uuid';
colNames[1] = 'flags';
var dataset = databaseManager.createEmptyDataSet(0,colNames);

var row = new Array();
row[0] = '413a4d69-becb-4ae4-8fdd-980755d6a7fb';//normally retreived via security.getElementUUIDs(...)
row[1] = JSSecurity.VIEWABLE|JSSecurity.ACCESSIBLE; // use bitwise 'or' for both
dataset.addRow(row);//setting element security

row = new Array();
row[0] = 'example_data.orders';
row[1] = JSSecurity.READ|JSSecurity.INSERT|JSSecurity.UPDATE|JSSecurity.DELETE|JSSecurity.TRACKING; //use
bitwise 'or' for multiple flags
dataset.addRow(row);//setting table security

security.setSecuritySettings(dataset); //to be called in solution startup method

```

setUserID**Boolean** **setUserID**(a_userUID, newUserUID)

Set a new userUID for the given userUID.

Parameters{**Object**} a_userUID – the userUID to set the new user UID for{**String**} newUserUID – the new user UID**Returns****Boolean** – true if changed**Sample**

```

var removeUser = true;
//create a user
var uid = security.createUser('myusername', 'mypassword');
if (uid) //test if user was created
{
    // Get all the groups
    var set = security.getGroups();
    for(var p = 1 ; p <= set.getMaxRowIndex() ; p++)
    {
        // output name of the group
        application.output(set.getValue(p, 2));
        // add user to group
        security.addUserToGroup(uid, set.getValue(p,2));
    }
    // if not remove user, remove user from all the groups
    if(!removeUser)
    {
        // get now all the groups that that users has (all if above did go well)
        var set =security.getUserGroups(uid);
        for(var p = 1;p<=set.getMaxRowIndex();p++)
        {
            // output name of the group
            application.output(set.getValue(p, 2));
            // remove the user from the group
            security.removeUserFromGroup(uid, set.getValue(p,2));
        }
    }
    else
    {
        // delete the user (the user will be removed from the groups)
        security.deleteUser(uid);
    }
}

```
