

JSColumnObject

 Apr 05, 2024 16:12

Supported Clients

SmartClient WebClient NGClient

Constants Summary

Number	DATABASE_IDENTITY	Constant used when setting or getting the sequence type of columns.
Number	DATABASE_SEQUENCE	Constant used when setting or getting the sequence type of columns.
Number	DATETIME	Constant used when setting or getting the type of columns.
Number	EXCLUDED_COLUMN	Constant used when setting or getting the flags of columns.
Number	INTEGER	Constant used when setting or getting the type of columns.
Number	MEDIA	Constant used when setting or getting the type of columns.
Number	NATIVE_COLUMN	Constant used when setting or getting the flags of columns.
Number	NONE	Constant for column information indicating unset values.
Number	NUMBER	Constant used when setting or getting the type of columns.
Number	PK_COLUMN	Constant used when setting or getting the row identifier type of columns.
Number	ROWID_COLUMN	Constant used when setting or getting the row identifier type of columns.
Number	SERVOY_SEQUENCE	Constant used when setting or getting the sequence type of columns.
Number	TENANT_COLUMN	Constant used when setting or getting the flags of columns.
Number	TEXT	Constant used when setting or getting the type of columns.
Number	UUID_COLUMN	Constant used when setting or getting the flags of columns.
Number	UUID_GENERATOR	Constant used when setting or getting the sequence type of columns.

Property Summary

Boolean	allowNull	Get or set the allow-null flag of a new column.
Number	rowIdentifierType	Get or set the row identifier type of the column.
Number	sequenceType	Get or set the sequence type of the column.

Methods Summary

String	getDataProviderID()	Get the data provider id for this column (which is the same as name if not explicitly defined otherwise).
String	getDefaultValue()	Get the default value of the column.
String	getDescription()	Get the description property of the column.
String	getForeignType()	Get the foreign type of the column.
Number	getLength()	Get the length of the column as reported by the JDBC driver.
String	getName()	Get the name of the column as used by Servoy.
String	getQualifiedName()	Get the qualified name (including table name) of the column as known by the database.
String	getQuotedSQLName()	Returns a quoted version of the column name, if necessary, as defined by the actual database used.
String	getSQLName()	Get the name of the column as known by the database.
Number	getSQLType()	Get the raw JDBC type of the column, which allows to check database specific types, like sting/byte column type variations.
Number	getScale()	Get the scale of the column as reported by the JDBC driver.
JSTable	getTable()	Get the JSTable of this column.
String	getTitle()	Get the title property of the column.
Number	getType()	Get the JDBC type of the column.
String	getTypeAsString()	Get the name JDBC type of the column.
Boolean	hasFlag(flag)	Check a flag of the column.
void	setDatabaseSequenceName(sequenceName)	Set the database sequence name of the column, used for columns with sequence type JSColumn.
void	setFlag(flag, set)	Set or clear a flag of a new column.

Constants Details

DATABASE_IDENTITY

Constant used when setting or getting the sequence type of columns.

Returns

Number

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
switch (column.getSequenceType())
{
case JSColumn.NONE:
    // handle column with no sequence
break;

case JSColumn.UUID_GENERATOR:
    // handle uuid generated column
break;
}
```

DATABASE_SEQUENCE

Constant used when setting or getting the sequence type of columns.

Returns[Number](#)**Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
switch (column.getSequenceType())
{
case JSColumn.NONE:
    // handle column with no sequence
break;

case JSColumn.UUID_GENERATOR:
    // handle uuid generated column
break;
}
```

DATETIME

Constant used when setting or getting the type of columns.

Returns[Number](#)**Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
switch (column.getType())
{
case JSColumn.TEXT:
    // handle text column
break;

case JSColumn.NUMBER:
case JSColumn.INTEGER:
    // handle numerical column
break;
}
```

EXCLUDED_COLUMN

Constant used when setting or getting the flags of columns.
This flag identifies columns that are skipped in the sql.

Returns[Number](#)**Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
if (column.hasFlag(JSColumn.UUID_COLUMN))
{
    // handle uuid column
}
```

INTEGER

Constant used when setting or getting the type of columns.

Returns[Number](#)**Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
switch (column.getType())
{
case JSColumn.TEXT:
    // handle text column
break;

case JSColumn.NUMBER:
case JSColumn.INTEGER:
    // handle numerical column
break;
}
```

MEDIA

Constant used when setting or getting the type of columns.

Returns[Number](#)**Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
switch (column.getType())
{
case JSColumn.TEXT:
    // handle text column
break;

case JSColumn.NUMBER:
case JSColumn.INTEGER:
    // handle numerical column
break;
}
```

NATIVE_COLUMN

Constant used when setting or getting the flags of columns.
This flag identifies columns that are marked as a native type column (for example uniqueidentifier).

Returns**Number****Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
if (column.hasFlag(JSColumn.UUID_COLUMN))
{
    // handle uuid column
}
```

NONE

Constant for column information indicating unset values.

Returns**Number****Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
switch (column.getSequenceType())
{
case JSColumn.NONE:
    // handle column with no sequence
break;

case JSColumn.UUID_GENERATOR:
    // handle uuid generated column
break;
}
```

NUMBER

Constant used when setting or getting the type of columns.

Returns**Number****Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
switch (column.getType())
{
case JSColumn.TEXT:
    // handle text column
break;

case JSColumn.NUMBER:
case JSColumn.INTEGER:
    // handle numerical column
break;
}
```

PK_COLUMN

Constant used when setting or getting the row identifier type of columns.
This value identifies columns that are defined as primary key in the database.

Returns**Number****Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
switch (column.getRowIdentifierType())
{
case JSColumn.NONE:
    // handle normal column
break;

case JSColumn.PK_COLUMN:
    // handle database pk column
break;

case JSColumn.ROWID_COLUMN:
    // handle developer defined pk column
break;
}
```

ROWID_COLUMN

Constant used when setting or getting the row identifier type of columns.

This value identifies columns that are defined as primary key by the developer (but not in the database).

Returns**Number****Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
switch (column.getRowIdentifierType())
{
case JSColumn.NONE:
    // handle normal column
break;

case JSColumn.PK_COLUMN:
    // handle database pk column
break;

case JSColumn.ROWID_COLUMN:
    // handle developer defined pk column
break;
}
```

SERVOY_SEQUENCE

Constant used when setting or getting the sequence type of columns.

Returns**Number****Supported Clients**

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
switch (column.getSequenceType())
{
    case JSColumn.NONE:
        // handle column with no sequence
        break;

    case JSColumn.UUID_GENERATOR:
        // handle uuid generated column
        break;
}
```

TENANT_COLUMN

Constant used when setting or getting the flags of columns.
This flag identifies columns that are marked as a tenant column.

Returns

[Number](#)

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
if (column.hasFlag(JSColumn.UUID_COLUMN))
{
    // handle uuid column
}
```

TEXT

Constant used when setting or getting the type of columns.

Returns

[Number](#)

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
switch (column.getType())
{
    case JSColumn.TEXT:
        // handle text column
        break;

    case JSColumn.NUMBER:
    case JSColumn.INTEGER:
        // handle numerical column
        break;
}
```

UUID_COLUMN

Constant used when setting or getting the flags of columns.
This flag identifies columns whose values are treated as UUID.

Returns

[Number](#)

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
if (column.hasFlag(JSColumn.UUID_COLUMN))
{
    // handle uuid column
}
```

UUID_GENERATOR

Constant used when setting or getting the sequence type of columns.

Returns

[Number](#)

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
switch (column.getSequenceType())
{
case JSColumn.NONE:
    // handle column with no sequence
break;

case JSColumn.UUID_GENERATOR:
    // handle uuid generated column
break;
}
```

Property Details**allowNull**

Get or set the allow-null flag of a new column.

Note that when a column is added to an existing table, allowNull will always be set.

For a primary key column, the allowNull flag will be always off, for other columns the flag is set by default.

Returns

[Boolean](#)

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var server = plugins.maintenance.getServer("example_data");
if (server)
{
    var table = server.createNewTable("users");
    if (table)
    {
        var pk = table.createNewColumn("id", JSColumn.MEDIA, 16); // can also use (JSColumn.TEXT, 36)
for UIDS
        pk.rowIdentifierType = JSColumn.PK_COLUMN;
        pk.setFlag(JSColumn.UUID_COLUMN, true)
        pk.sequenceType = JSColumn.UUID_GENERATOR
        var c = table.createNewColumn("name", JSColumn.TEXT, 100);
        c.allowNull = false
        table.createNewColumn("age", JSColumn.INTEGER, 0);
        table.createNewColumn("last_login", JSColumn.DATETIME, 0);
        var result = server.synchronizeWithDB(table);
        if (result) application.output("Table successfully created.");
        else application.output("Table not created.");
    }
}
```

rowIdentifierType

Get or set the row identifier type of the column.
The sequence type is one of:
 - JSColumn.PK_COLUMN
 - JSColumn.ROWID_COLUMN
 - JSColumn.NONE

Returns

[Number](#)

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var server = plugins.maintenance.getServer("example_data");
if (server)
{
    // users has uuid pk
    var table = server.createNewTable("users");
    if (table)
    {
        var pk = table.createNewColumn("id", JSColumn.MEDIA, 16); // can also use <JSColumn.TEXT, 36>
    for UUIDs)
        pk.rowIdentifierType = JSColumn.PK_COLUMN;
        pk.setFlag(JSColumn.UUID_COLUMN, true)
        pk.sequenceType = JSColumn.UUID_GENERATOR
        table.createNewColumn("name", JSColumn.TEXT, 100);
        var result = server.synchronizeWithDB(table);
        if (result) application.output("Table users successfully created.");
        else application.output("Table users not created.");
    }

    // groups has database sequence pk
    table = server.createNewTable("groups");
    if (table)
    {
        pk = table.createNewColumn("id", JSColumn.INTEGER, 0);
        pk.rowIdentifierType = JSColumn.PK_COLUMN;
        pk.sequenceType = JSColumn.DATABASE_SEQUENCE
        pk.setDatabaseSequenceName('mygroupsequence')
        table.createNewColumn("name", JSColumn.TEXT, 100);
        result = server.synchronizeWithDB(table);
        if (result) application.output("Table groups successfully created.");
        else application.output("Table groups not created.");
    }
}
```

sequenceType

Get or set the sequence type of the column.
The sequence type is one of:

- JSColumn.NONE
- JSColumn.SERVOY_SEQUENCE
- JSColumn.DATABASE_SEQUENCE
- JSColumn.DATABASE_IDENTITY
- JSColumn.UUID_GENERATOR;

Returns

[Number](#)

Supported Clients

SmartClient, WebClient, NGClient

Sample

```

var server = plugins.maintenance.getServer("example_data");
if (server)
{
    // users has uuid pk
    var table = server.createNewTable("users");
    if (table)
    {
        var pk = table.createNewColumn("id", JSColumn.MEDIA, 16); // can also use <JSColumn.TEXT, 36>
    for UUIDs)
        pk.rowIdentifierType = JSColumn.PK_COLUMN;
        pk.setFlag(JSColumn.UUID_COLUMN, true)
        pk.sequenceType = JSColumn.UUID_GENERATOR
        table.createNewColumn("name", JSColumn.TEXT, 100);
        var result = server.synchronizeWithDB(table);
        if (result) application.output("Table users successfully created.");
        else application.output("Table users not created.");
    }

    // groups has database sequence pk
    table = server.createNewTable("groups");
    if (table)
    {
        pk = table.createNewColumn("id", JSColumn.INTEGER, 0);
        pk.rowIdentifierType = JSColumn.PK_COLUMN;
        pk.sequenceType = JSColumn.DATABASE_SEQUENCE
        pk.setDatabaseSequenceName('mygroupsequence')
        table.createNewColumn("name", JSColumn.TEXT, 100);
        result = server.synchronizeWithDB(table);
        if (result) application.output("Table groups successfully created.");
        else application.output("Table groups not created.");
    }
}

```

Methods Details**getDataProviderID()**

Get the data provider id for this column (which is the same as name if not explicitly defined otherwise).

Returns

String String dataprovider id.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```

var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
var dataProviderId = column.getDataProviderID()

```

getDefaultValue()

Get the default value of the column.

Returns

String String column default value.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```

var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
var format = column.getDefaultFormat()

```

getDescription()

Get the description property of the column.

Returns

String String column description.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customername')
var desc = column.getDescription()
```

getForeignType()

Get the foreign type of the column.

The foreign type can be defined design time as a foreign key reference to another table.

Returns

String String foreign type.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
var foreignType = column.getForeignType()
if (foreignType != null)
{
    var fkTable = databaseManager.getTable('example_data', foreignType)
}
```

getLength()

Get the length of the column as reported by the JDBC driver.

Returns

Number int column length.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customername')
if (column.getLength() < 10)
{
    // handle short column
}
```

getName()

Get the name of the column as used by Servoy.

Returns

String String column name

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
var colName = column.getName()
```

getQualifiedName()

Get the qualified name (including table name) of the column as known by the database.
The name is quoted, if necessary, as defined by the actual database used.

Returns

[String](#) String qualified column name.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
var qualifiedSqlName = column.getQualifiedName()
```

getQuotedSQLName()

Returns a quoted version of the column name, if necessary, as defined by the actual database used.

Returns

[String](#) column name, quoted if needed.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
//use with the raw SQL plugin:
//if the table name contains characters that are illegal in sql, the table name will be quoted
var jsTable = databaseManager.getTable('udm', 'campaigns')
var quotedTableName = jsTable.getQuotedSQLName()
var jsColumn = jsTable.getColumn('active')
var quotedColumnName = jsColumn.getQuotedSQLName()
plugins.rawSQL.executeSQL('udm', quotedTableName, 'select * from ' + quotedTableName + ' where ' +
quotedColumnName + ' = ?', [1])
```

getSQLName()

Get the name of the column as known by the database.

Returns

[String](#) String sql name

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
var sqlName = column.getSQLName()
```

getSQLType()

Get the raw JDBC type of the column, which allows to check database specific types, like sting/byte column type variations.

Returns

[Number](#) int sql type.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
var sqlType = column.getSQLType();
```

getScale()

Get the scale of the column as reported by the JDBC driver.

Returns

[Number](#) int column scale.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customername')
var scale = column.getScale()
```

getTable()

Get the JSTable of this column.

Returns

[JSTable](#) table The JSTable of this column.

Supported Clients

SmartClient, WebClient, NGClient

Sample**getTitle()**

Get the title property of the column. If title is null will return column name.

Returns

[String](#) String column title.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customername')
var title = column.getTitle()
```

getType()

Get the JDBC type of the column.

The type reported by the JDBC driver will be mapped to one of:

- [JSColumn.DATETIME](#)
- [JSColumn.TEXT](#)
- [JSColumn.NUMBER](#)
- [JSColumn.INTEGER](#)
- [JSColumn.MEDIA](#)

Returns

[Number](#) int sql type.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
switch (column.getType())
{
    case JSColumn.TEXT:
        // handle text column
        break;

    case JSColumn.NUMBER:
    case JSColumn.INTEGER:
        // handle numerical column
        break;
}
```

getTypeAsString()

Get the name JDBC type of the column.
The same mapping as defined in `JSColumn.getType()` is applied.

Returns

`String` String sql name.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
var typeName = column.getTypeAsString()
```

hasFlag(flag)

Check a flag of the column.
The flags are a bit pattern consisting of 1 or more of the following bits:

- `JSColumn.UUID_COLUMN`
- `JSColumn.EXCLUDED_COLUMN`
- `JSColumn.TENANT_COLUMN`
- `JSColumn.NATIVE_COLUMN`

Parameters

`Number` flag ;

Returns

`Boolean` boolean whether flag is set.

Supported Clients

SmartClient, WebClient, NGClient

Sample

```
var table = databaseManager.getTable('db:/example_data/orders')
var column = table.getColumn('customerid')
if (column.hasFlag(JSColumn.UUID_COLUMN))
{
    // handle uuid column
}
```

setDatabaseSequenceName(sequenceName)

Set the database sequence name of the column, used for columns with sequence type `JSColumn.DATABASE_SEQUENCE`.

Parameters

`String` sequenceName the sequence name

Supported Clients

SmartClient, WebClient, NGClient

Sample

```

var server = plugins.maintenance.getServer("example_data");
if (server)
{
    // users has uuid pk
    var table = server.createNewTable("users");
    if (table)
    {
        var pk = table.createNewColumn("id", JSColumn.MEDIA, 16); // can also use <JSColumn.TEXT, 36>
    for UUIDs)
        pk.rowIdentifierType = JSColumn.PK_COLUMN;
        pk.setFlag(JSColumn.UUID_COLUMN, true)
        pk.sequenceType = JSColumn.UUID_GENERATOR
        table.createNewColumn("name", JSColumn.TEXT, 100);
        var result = server.synchronizeWithDB(table);
        if (result) application.output("Table users successfully created.");
        else application.output("Table users not created.");
    }

    // groups has database sequence pk
    table = server.createNewTable("groups");
    if (table)
    {
        pk = table.createNewColumn("id", JSColumn.INTEGER, 0);
        pk.rowIdentifierType = JSColumn.PK_COLUMN;
        pk.sequenceType = JSColumn.DATABASE_SEQUENCE
        pk.setDatabaseSequenceName('mygroupsequence')
        table.createNewColumn("name", JSColumn.TEXT, 100);
        result = server.synchronizeWithDB(table);
        if (result) application.output("Table groups successfully created.");
        else application.output("Table groups not created.");
    }
}

```

setFlag(flag, set)

Set or clear a flag of a new column.

The flags are a bit pattern consisting of 1 or more of the following bits:

- JSColumn.UUID_COLUMN;
- JSColumn.EXCLUDED_COLUMN;

Parameters

Number flag the flag to set

Boolean set true for set flag, false for clear flag

Supported Clients

SmartClient, WebClient, NGClient

Sample

```

var server = plugins.maintenance.getServer("example_data");
if (server)
{
    var table = server.createNewTable("users");
    if (table)
    {
        var pk = table.createNewColumn("id", JSColumn.MEDIA, 16); // can also use (JSColumn.TEXT, 36)
    for UUIDs)
        pk.rowIdentifierType = JSColumn.PK_COLUMN;
        pk.setFlag(JSColumn.UUID_COLUMN, true)
        pk.sequenceType = JSColumn.UUID_GENERATOR
        var c = table.createNewColumn("name", JSColumn.TEXT, 100);
        c.allowNull = false
        table.createNewColumn("age", JSColumn.INTEGER, 0);
        table.createNewColumn("last_login", JSColumn.DATETIME, 0);
        var result = server.synchronizeWithDB(table);
        if (result) application.output("Table successfully created.");
        else application.output("Table not created.");
    }
}

```
