

RelationInfo

Method Summary

void [setLabel](#)(label)
Sets the label of a relation info object used to set multiple child relations for a tree node.

void [setNRelationName](#)(relationName)
Sets the name of a relation info object used to set multiple child relations for a tree node.

Method Details

setLabel

void **setLabel** (label)
Sets the label of a relation info object used to set multiple child relations for a tree node.

Parameters

{[String](#)} label

Returns

void

Sample

```
var companies_binding = elements.myDbTreeView.createBinding('example_data', 'companies');  
var company_relations = new Array();  
company_relations[0] = elements.myDbTreeView.createRelationInfo();  
company_relations[0].setLabel('Employees');  
company_relations[0].setNRelationName('companies_to_employees');  
companies_binding.setNRelationInfos(company_relations);
```

setNRelationName

void **setNRelationName** (relationName)
Sets the name of a relation info object used to set multiple child relations for a tree node.

Parameters

{[String](#)} relationName

Returns

void

Sample

```
var companies_binding = elements.myDbTreeView.createBinding('example_data', 'companies');  
var company_relations = new Array();  
company_relations[0] = elements.myDbTreeView.createRelationInfo();  
company_relations[0].setLabel('Employees');  
company_relations[0].setNRelationName('companies_to_employees');  
companies_binding.setNRelationInfos(company_relations);
```
