JS Lib

Return Types

Array Boolean Date Function JSON Math Number Object RegExp Special Operators Statements String

Property Summary

Number	Infinity Numeric value representing infinity.
Number	NaN Value representing Not-a-Number.
Object	undefined The value undefined.

Method Summary

String	decodeURI(encodedURI) Decodes a URI previously encoded with encodeURI or another similar routine.
String	decodeURIComponent(encodedURI) Decodes a URI component previously created by encodeURIComponent or by a similar routine.
String	encodeURI(URI) Encodes a URI by replacing certain characters with escape sequences.
String	encodeURIComponent(URI) Encodes a URI component by replacing all special characters with their corresponding UTF-8 escape sequences.
Object	eval(expression) Evaluates JavaScript code passed as a string.
Boolean	isFinite(n) Returns true if the given number is a finite number.
void	isNaN(value) The NaN property indicates that a value is 'Not a Number'.
Number	parseFloat(text) Makes a floating point number from the starting numbers in a given string.
Number	parseInt(text) Makes a integer from the starting numbers in a given string in the base specified.
Number	parseInt(text, radix) Makes a integer from the starting numbers in a given string in the base specified.
String	uneval(obj) Returns the string representation behind a given object.

Property Details

Infinity

Numeric value representing infinity.

Returns

Number

Sample

```
Infinity
```

NaN

Value representing Not-a-Number.

Returns

Number

Sample

```
NaN
```

undefined
The value undefined.
Returns

Object
Sample

```
undefined
```

Method Details

decodeURI
String **decodeURI** (encodedURI)
Decodes a URI previously encoded with encodeURI or another similar routine.
Parameters

{String} encodedURI
Returns

String
Sample

```
var str = "http://www.mysite.com/my code.asp?name=[cool]";
var encoded = encodeURI(str);
var decoded = decodeURI(encoded);
application.output(encoded);//http://www.mysite.com/my%20code.asp?name=%5bcool%5d
application.output(decoded);//http://www.mysite.com/my code.asp?name=[cool]
```

decodeURIComponent
String **decodeURIComponent** (encodedURI)
Decodes a URI component previously created by encodeURIComponent or by a similar routine.
Parameters

{String} encodedURI
Returns

String
Sample

```
var str = "my code.asp?name=[cool]";
var encoded = encodeURIComponent(str);
var decoded = decodeURIComponent(encoded);
application.output(encoded); //my%20code.asp%3fname%3d%5bcool%5d
application.output(decoded); //my code.asp?name=[cool]
```

encodeURI
String **encodeURI** (URI)
Encodes a URI by replacing certain characters with escape sequences.
Parameters

{String} URI
Returns

String

Sample

```
var str = "http://www.mysite.com/my code.asp?name=[cool]";
var encoded = encodeURI(str);
var decoded = decodeURI(encoded);
application.output(encoded);//http://www.mysite.com/my%20code.asp?name=%5bcool%5d
application.output(decoded);//http://www.mysite.com/my code.asp?name=[cool]
```

encodeURIComponent

String **encodeURIComponent** (URI)
Encodes a URI component by replacing all special characters with their corresponding UTF-8 escape sequences.
Parameters

{String} URI
Returns

String
Sample

```
var str = "my code.asp?name=[cool]";
var encoded = encodeURIComponent(str);
var decoded = decodeURIComponent(encoded);
application.output(encoded); //my%20code.asp%3fname%3d%5bcool%5d
application.output(decoded); //my code.asp?name=[cool]
```

eval

Object **eval** (expression)
Evaluates JavaScript code passed as a string. Returns the value returned by the evaluated code.
Parameters

{String} expression
Returns

Object
Sample

```
eval("var x = 2 + 3;");
application.output(x); // prints: 5.0
```

isFinite

Boolean **isFinite** (n)
Returns true if the given number is a finite number.
Parameters

{Number} n
Returns

Boolean
Sample

```
application.output(isFinite(1)); // prints: true
application.output(isFinite(Infinity)); // prints: false
application.output(isFinite(isNaN)); // prints: false
```

isNaN

void **isNaN** (value)
The NaN property indicates that a value is 'Not a Number'.
Parameters

{Object} value

Returns

void
Sample

```
isNaN( value )
```

parseFloat

Number **parseFloat** (text)
Makes a floating point number from the starting numbers in a given string.
Parameters

{String} text
Returns

Number
Sample

```
parseFloat('string')
```

parseInt

Number **parseInt** (text)
Makes a integer from the starting numbers in a given string in the base specified.
Parameters

{String} text
Returns

Number
Sample

```
parseInt('0774')
```

parseInt

Number **parseInt** (text, radix)
Makes a integer from the starting numbers in a given string in the base specified.
Parameters

{String} text
{Number} radix
Returns

Number
Sample

```
parseInt('0774' , 8)
```

uneval

String **uneval** (obj)
Returns the string representation behind a given object.
Parameters

{Object} obj
Returns

String

Sample

```
application.output(uneval(isNaN)); // prints something like: function isNaN() { [native code for isNaN,
arity=1] }
```
