Servoy Repository

The Servoy Repository is a set of tables in a database, containing all the metadata of deployed solutions.

The metadata contains, among other things the following:

- Solution design
- Solution versions
- Users & user groups

The Servoy Application Server requires to have a named server connection with the name 'repository_server', which points to the database hosting the Servoy Repository tables.

See Servoy Repository Upgrade for more information on the creation and upgrade of a Servoy Repository.
