
Servoy Headless Client

The Servoy Headless Client is a client that is instantiated/started through (Java) code. It provides programmatic access to solutions developed in Servoy and exposes the business logic and data layer of the solutions.

The Servoy Headless Client can, for example, be used in:

- Java applications
- Java Servlets
- Java Server Pages (JSP)

The benefits of the Servoy Headless Client are that business logic already developed in a solution in Servoy can be re-used in external systems, while keeping the [Databroadcasting](#) mechanism of Servoy intact.
