Servoy Headless Client

The Servoy Headless Client is a client that is instantiated/started though (Java) code. It provides programmatic access to solutions developed in Servoy and exposes the business logic and datalayer of the solutions.

The Servoy Headless Client can, for example be used in:

- Java applications
- Java Servlets
- Java Server Pages (JSP)

The benefits of the Servoy Headless Client are that business logic already developed in a solution in Servoy can be re-used in external systems, while keeping the Databroadcasting mechanism of Servoy intact.
