# Installing Subclipse

Subclipse SVN Client is a SVN Team Provider client for the Eclipse platform (the platform utilized by Servoy Developer). Subclipse is available as plug-in for Eclipse and is available through Eclipse's new software wizard.
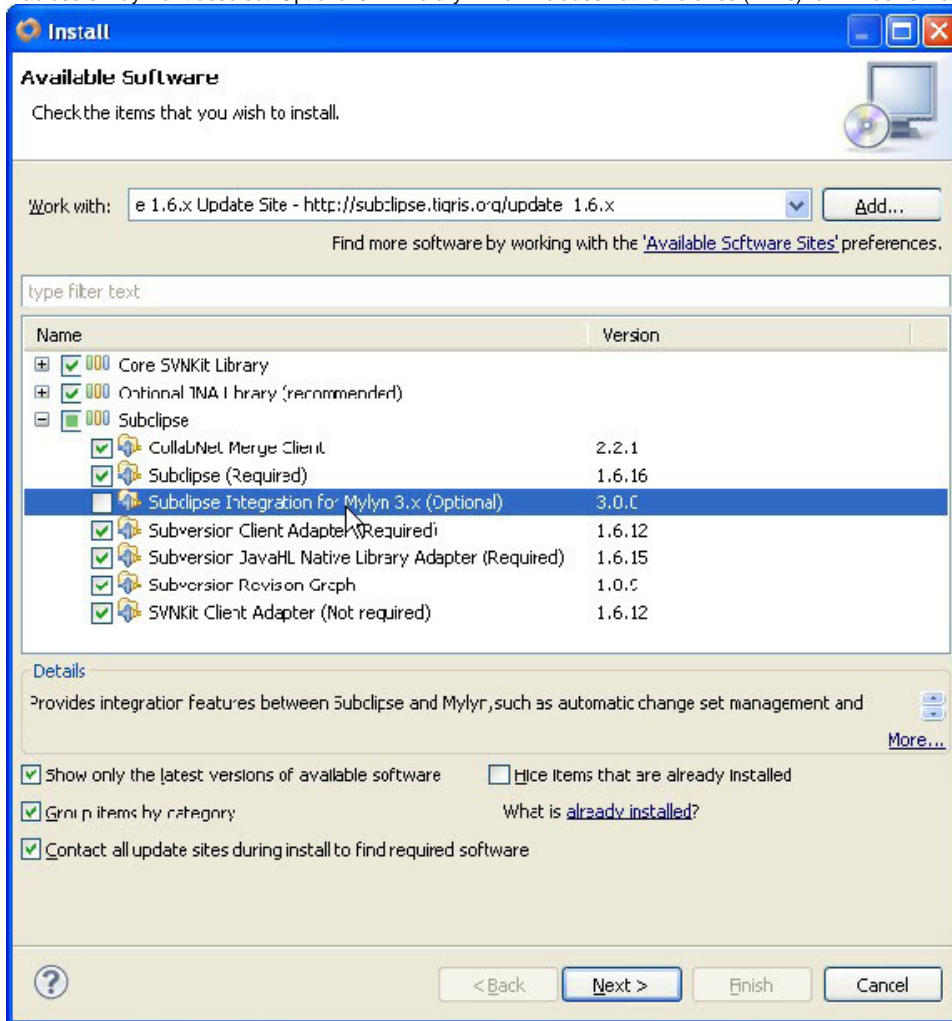

Steps to Install

1. From the menu bar, select **Help** > **Install New Software**

2. Select the **Subclipse Update Site**

3. Select all the required options. You may want to deselect 'Subclipse Integration for Mylyn' as it is likely not needed and requires additional libraries. Mac users may want deselect 'Optional JNA Library' which includes native libraries (DLLs) for Windows machines.

4. Review the packages to be installed
5. Accept the Licensing Agreement
6. While installing, you may be asked trust the Update Site's certificate. Follow instructions to trust the certificate.
7. After the plug-in is installed, you will be prompted to restart Servoy Developer, which is required prior to using the Subclipse Plug-In

⚠ **For 64 bit OS machines**

If you are using a 64-bit OS, you may need to do some additional installation. Otherwise, you will see problems later when using Subclipse.

The JavaHL version that ships with Subclipse is a 32-bit version. To get a 64-bit version, simply download the 64-bit SlikSVN: http://www.sliksvn.com/en/download then install with all default options. JavaHL should recognise the 64-bit libraries now (may require a machine restart.)
