

# RuntimeComponent

## Property Summary

String	<code>#bgcolor</code>	Gets or sets the background color of a field.
String	<code>#border</code>	Gets or sets the border attribute(s) of a specified element.
Boolean	<code>#enabled</code>	Gets or sets the enabled state of a specified field, also known as "grayed".
String	<code>#fgcolor</code>	Gets or sets the foreground color of a field.
Boolean	<code>#visible</code>	Gets or sets the visibility of an element; true - visible; false - not visible; ! - the visibility state is inverted (the opposite).

## Method Summary

Number	<code>#getAbsoluteFormLocationY()</code>	Returns the absolute form (designed) Y location.
Object	<code>#getClientProperty(key)</code>	Gets the specified client property for the element based on a key.
String	<code>#getElementType()</code>	Returns the type of a specified element.
Number	<code>#getHeight()</code>	Returns the height of the current element.
Number	<code>#getLocationX()</code>	Returns the x location of the current element.
Number	<code>#getLocationY()</code>	Returns the y location of the current element.
String	<code>#getName()</code>	Returns the name of an element.
Number	<code>#getWidth()</code>	Returns the width of the current element.
void	<code>#putClientProperty(key, value)</code>	Sets the value for the specified element client property key.
void	<code>#setLocation(x, y)</code>	Sets the location of an element.
void	<code>#setSize(width, height)</code>	Sets the size of the field.

## Property Details

### bgcolor

Gets or sets the background color of a field. The color has to be set using the hexadecimal RGB value as used in HTML.

#### Returns

String

#### Sample

```
//sets the background color of the field
forms.customer.elements.customer_id.bgcolor = "#FFFFFF";
//gets the background color of the field
var c = forms.customer.elements.customer_id.bgcolor;
```

## border

Gets or sets the border attribute(s) of a specified element.

The border attributes:

borderType - EmptyBorder, EtchedBorder, BevelBorder, LineBorder, TitleBorder, MatteBorder, SpecialMatteBorder.  
size - (numeric value) for: bottom, left, right, top.  
color - (hexadecimal value) for: bottom, left, right, top.  
dash pattern - (numeric value) for selected side(s).  
rounding radius - (numeric value) for selected side(s).

NOTE: Use the same value(s) and order of attribute(s) from the element design time property "borderType".

### Parameters

spec – the border attributes

### Returns

String

### Sample

```
//sets the border type to "LineBorder"  
//sets a 1 px line width for the bottom and left side of the border  
//sets the hexadecimal color of the border to "#ccffcc"  
var b = forms.customer.elements.customer_id.setBorder('LineBorder',1,#ccffcc');
```

## enabled

Gets or sets the enabled state of a specified field, also known as "grayed".

true - enabled; false - not enabled; ! - the enabled state is inverted (the opposite).

NOTE: A disabled element cannot be selected by clicking the element (or by pressing the TAB key even if this option is supported by the operating system).

NOTE: A label or button element will not disable if the "displayType" design time property for a field is set to HTML\_AREA.

NOTE: The disabled "grayed" color is dependent on the LAF set in the Servoy Client Application Preferences. For more information see Preferences: Look And Feel in the Servoy Developer User's Guide.

### Returns

Boolean

### Sample

```
//gets the enabled state of the field  
var currState = forms.customer.elements.customer_id.enabled;  
  
//sets the enabled state of the field  
forms.customer.elements.customer_id.enabled = !currentState;
```

## fgcolor

Gets or sets the foreground color of a field. The color has to be set using the hexadecimal RGB value as used in HTML.

### Returns

String

### Sample

```
//sets the foreground color of the field  
forms.customer.elements.customer_id.fgcolor = "#000000";  
  
//gets the foreground color of the field  
var c = forms.customer.elements.customer_id.fgcolor;
```

### **visible**

Gets or sets the visibility of an element; true - visible; false - not visible; ! - the visibility state is inverted (the opposite).

NOTE: The visibility of an element is not persistent; the state of visibility only applies to the current user in his/her current session.

#### **Returns**

**Boolean**

#### **Sample**

```
//sets the element as visible  
forms.company.elements.faxBtn.visible = true;  
  
//gets the visibility of the element  
var currentState = forms.company.elements.faxBtn.visible;  
  
//sets the element as not visible when the current state is visible  
forms.company.elements.faxBtn.visible = !currentState;
```

### **Method Details**

#### **getAbsoluteFormLocationY**

**Number getAbsoluteFormLocationY()**

Returns the absolute form (designed) Y location.

#### **Returns**

**Number** – The y location of the form in pixels.

#### **Sample**

```
var absolute_y = forms.customer.elements.customer_id.getAbsoluteFormLocationY();
```

#### **getClientProperty**

**Object getClientProperty(key)**

Gets the specified client property for the element based on a key.

NOTE: Depending on the operating system, a user interface property name may be available.

#### **Parameters**

{**Object**} key – user interface key (depends on operating system)

#### **Returns**

**Object** – The value of the property for specified key.

#### **Sample**

```
var property = forms.customer.elements.customer_id.getClientProperty('ToolTipText');
```

#### **getElementType**

**String getElementType()**

Returns the type of a specified element.

#### **Returns**

**String** – The display type of the element as String.

#### **Sample**

```
var et = forms.customer.elements.customer_id.getElementType();
```

#### **getHeight**

**Number getHeight()**

Returns the height of the current element.

NOTE: getHeight() can be used with getWidth() to set the size of an element using the setSize function. For example:

```
//returns the width (w) and height (h)
var w = forms.company.elements.faxBtn.getWidth();
var h = forms.company.elements.faxBtn.getHeight();

//sets the new size
forms.company.elements.faxBtn.setSize(w,h);

//sets the new size and adds 1 px to both the width and height
forms.company.elements.faxBtn.setSize(w+1,h+1);
```

**Returns**

**Number** – The height of the element in pixels.

**Sample**

```
var ht = forms.customer.elements.customer_id.getHeight();
```

getLocationX

**Number getLocationX()**

Returns the x location of the current element.

NOTE: getLocationX() can be used with getLocationY() to set the location of an element using the setLocation function. For Example:

```
//returns the X and Y coordinates
var x = forms.company.elements.faxBtn.getLocationX();
var y = forms.company.elements.faxBtn.getLocationY();

//sets the new location 10 px to the right; 10 px down from the current location
forms.company.elements.faxBtn.setLocation(x+10,y+10);
```

**Returns**

**Number** – The x location of the element in pixels.

**Sample**

```
var x = forms.customer.elements.customer_id.getLocationX();
```

getLocationY

**Number getLocationY()**

Returns the y location of the current element.

NOTE: getLocationY() can be used with getLocationX() to set the location of an element using the setLocation function. For Example:

```
//returns the X and Y coordinates
var x = forms.company.elements.faxBtn.getLocationX();
var y = forms.company.elements.faxBtn.getLocationY();

//sets the new location 10 px to the right; 10 px down from the current location
forms.company.elements.faxBtn.setLocation(x+10,y+10);
```

**Returns**

**Number** – The y location of the element in pixels.

**Sample**

```
var y = forms.customer.elements.customer_id.getLocationY();
```

getName

**String getName()**

Returns the name of an element. (may be null as well)

**Returns**

**String** – The name of the element.

**Sample**

```
var name = forms.customer.elements.customer_id.getName();
```

getWidth

**Number getWidth()**

Returns the width of the current element.

NOTE: getWidth() can be used with getHeight() to set the size of an element using the setSize function. For Example:

```
//returns the width (w) and height (h)
var w = forms.company.elements.faxBtn.getWidth();
var h = forms.company.elements.faxBtn.getHeight();

//sets the new size
forms.company.elements.faxBtn.setSize(w,h);

//sets the new size and adds 1 px to both the width and height
forms.company.elements.faxBtn.setSize(w+1,h+1);
```

**Returns**

**Number** – The width of the element in pixels.

**Sample**

```
var w = forms.customer.elements.customer_id.getWidth();
```

**putClientProperty**

void **putClientProperty**(key, value)

Sets the value for the specified element client property key.

NOTE: Depending on the operating system, a user interface property name may be available.

**Parameters**

{Object} key – user interface key (depends on operating system)

{Object} value – a predefined value for the key

**Returns**

void

**Sample**

```
forms.customer.elements.customer_id.putClientProperty('ToolTipText', 'some text');
```

**setLocation**

void **setLocation**(x, y)

Sets the location of an element. It takes as input the X (horizontal) and Y (vertical) coordinates - starting from the TOP LEFT side of the screen.

NOTE: getLocationX() can be used with getLocationY() to return the current location of an element; then use the X and Y coordinates with the setLocation function to set a new location. For Example:

```
//returns the X and Y coordinates
var x = forms.company.elements.faxBtn.getLocationX();
var y = forms.company.elements.faxBtn.getLocationY();

//sets the new location 10 px to the right; 10 px down from the current location
forms.company.elements.faxBtn.setLocation(x+10,y+10);
```

**Parameters**

{Number} x – the X coordinate of the element in pixels.

{Number} y – the Y coordinate of the element in pixels.

**Returns**

void

**Sample**

```
forms.customer.elements.customer_id.setLocation(200,200);
```

**setSize**

void **setSize**(width, height)

Sets the size of the field. It takes as input the width and the height.

NOTE: getWidth() can be used with getHeight() to set the size of an element using the setSize function. For Example:

```
//returns the width (w) and height (h)
var w = forms.company.elements.faxBtn.getWidth();
var h = forms.company.elements.faxBtn.getHeight();

//sets the new size
forms.company.elements.faxBtn.setSize(w,h);

//sets the new size and adds 1 px to both the width and height
forms.company.elements.faxBtn.setSize(w+1,h+1);
```

**Parameters**

{Number} width – the width of the element in pixels.  
{Number} height – the height of the element in pixels.

**Returns**

void

**Sample**

```
forms.customer.elements.customer_id.setSize(20,30);
```
