
Running the All-In-One Installer

The Servoy All-In-One installer is capable of installing both the Servoy Application Server and Servoy Developer.

This chapter describes the process of installing the Servoy Application Server. For information on the installation of Servoy Developer, refer to the [Developer User Guide](#).

The All-In-One installer requires the target environment to have a Graphical User Interface in order to run the installer. For environments without a GUI, see [Performing an Unattended Installation](#).

Choosing the Correct Installer

The Servoy All-In-One installer comes in 2 variations:

- The cross platform installer (.jar)
- The Windows executable installer (.exe)

The cross platform installer can also be used on the Windows platform, but some virus scanners block the execution of .jar files. Therefore, the Windows executable installer is provided as alternative.

Running the Installer

To start the installation, execute the installer. Depending on the platform, either double click the `servoy_installer.jar` or execute the following through the command line or terminal window:

```
java -jar servoy_installer.jar
```

When double clicking, the cross platform installer may open the `servoy_installer.jar` as an archive file instead of an executable, because the .jar extension may not be configured to be opened with Java. Either use the command line option, use the platform's **Open with** option or configure the platform to open .jar files using Java.

Stepping Through the Installer

Step 1 - Welcome Page

When the installer opens, the screenshot below will represent itself. Click **Next** to continue.

Step 3 - License Agreement

Accept the License agreement and click **Next** to continue.

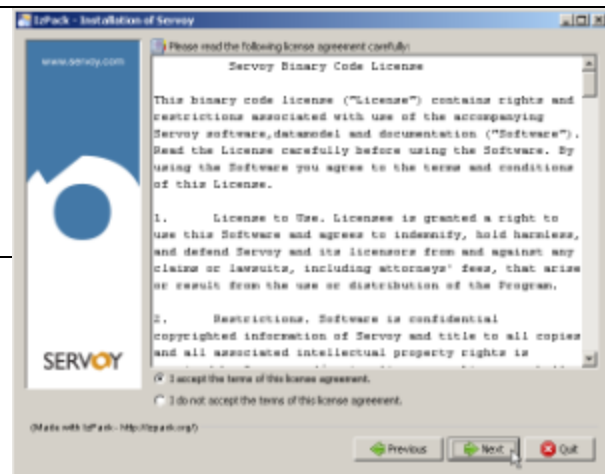

Step 4 - Installation Location

The following screen allows the installer to set the location where the Servoy Application Server will be installed. If required, provide a different location and click **Next** to continue.

The user under which the Servoy

Application Server will run requires read/write access rights on the directory in which the Servoy Application Server is installed.

Step 5 - Options

The following screen allows the specification of which optional packs to include in the installation.

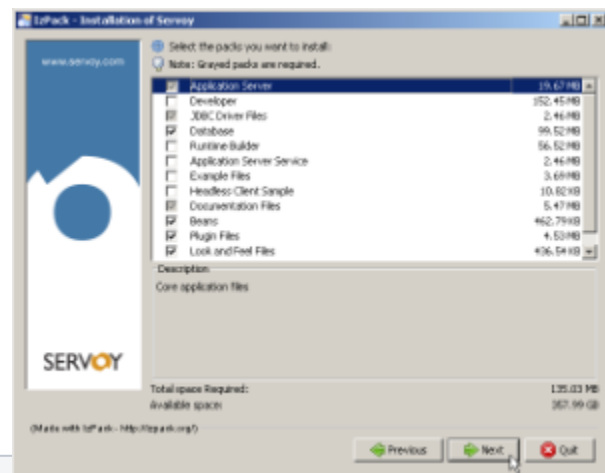

For a Servoy Application Server only installation, uncheck the **Developer** and **Example Files** packs.

When the installation does not require [PostgreSQL](#) for either the [Servoy Repository](#) or solution data, or when the [PostgreSQL](#) engine is already installed, uncheck the **Database** pack. Check the [Installing on Existing Databases](#) chapter for more information when unchecking this pack.

When the Servoy Application Server needs to run as a service under the operating system, check the **Application Server Service** pack.

Clicking **Next** will start the installation of the Servoy Application Server.

Available Packs

Pack	Mandatory	Contents
Application Server	Yes	Servoy Application Server
Developer	No	Servoy Developer
JDBC Driver Files	Yes	JDBC drivers shipped with Servoy by default
Database	No	PostgreSQL database engine as well as the sample databases shipped with Servoy
Runtime Builder	No	Servoy Developer plugin to create the Servoy Runtime Client
Application Server Service	No	Feature to install the Servoy Application Server as a Service
Example Files	No	Sample solutions

Headless Client Sample	No	Servoy Headless Client sample
Documentation Files	Yes	Servoy Client documentation
Beans	No	All default beans
Plugins	No	All default plugins
Look and Feel Files	No	Several Java Swing Look and Feel files for customizing the Servoy Smart Client appearance
PDF Support Package	No	PDF Output Plugin to support for working with PDFs to Servoy

Step 6 - Installation Progress

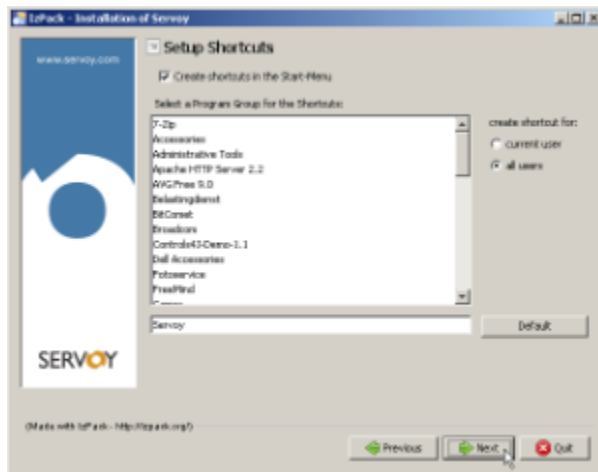

The following screen shows the installation progress. When finished, click **Next** to continue.

Step 7 - Shortcuts

The following screen allows the creation of shortcuts in the Start Menu. This option is only available on Windows.

Uncheck the **Create shortcuts in the Start Menu** if not required, and click **Next**.

Step 8 - Installation Script

The last screen allows for the creation of an installer script for [Performing an Unattended Installation](#).

The installation is now complete and, with default configuration, the Servoy Application Server is ready to use.

If the Database option was unchecked, check out [Installing on Existing Databases](#).

Refer to the chapter [Configuring the Server](#) to learn more about further configuration of the Servoy Application Server. For example, to run the Servoy Application Server on different ports than the default ones.

See chapter [Operating the Server](#) for information on how to start the Servoy Application Server.
