

JSDataSourceNode

Method Summary

JSCalculation	getCalculation(name) Get an existing calculation for the datasource node.
JSCalculation[]	getCalculations() Gets all the calculations for the datasource node.
String	getDataSource() Get the data source for this node.
JSMethod	getMethod(name) Get an existing foundset method for the datasource node.
JSMethod[]	getMethods() Gets all the foundset methods for the datasource node.
JSCalculation	newCalculation(code) Creates a new calculation for the given code, the type will be the column where it could be build on (if name is a column name), else it will default to JSVariable.
JSCalculation	newCalculation(code, type) Creates a new calculation for the given code and the type, if it builds on a column (name is a column name) then type will be ignored.
JSMethod	newMethod(code) Creates a new foundset method with the specified code.
Boolean	removeCalculation(name) Removes the calculation specified by name.
Boolean	removeMethod(name) Removes the foundset method specified by name.

Method Details

getCalculation

[JSCalculation](#) [getCalculation](#) (name)
Get an existing calculation for the datasource node.

Parameters

{[String](#)} name - The name of the calculation

Returns

[JSCalculation](#)

Sample

```
var calc = solutionModel.getDataSourceNode("db:/example_data/customers").newCalculation("function
myCalculation() { return 123; }", JSVariable.INTEGER);
var calc2 = solutionModel.getDataSourceNode("db:/example_data/customers").newCalculation("function
myCalculation2() { return '20'; }");
var calc3 = solutionModel.getDataSourceNode("db:/example_data/employees").newCalculation("function
myCalculation3() { return 'Hello World!'; }", JSVariable.TEXT);

var c = solutionModel.getDataSourceNode("db:/example_data/customers").getCalculation("myCalculation");
application.output("Name: " + c.getName() + ", Stored: " + c.isStored());

var allCalcs = solutionModel.getDataSourceNode("db:/example_data/customers").getCalculations();
for (var i = 0; i < allCalcs.length; i++) {
    application.output(allCalcs[i]);
}
```

getCalculations

[JSCalculation\[\]](#) [getCalculations](#) ()
Gets all the calculations for the datasource node.

Returns

[JSCalculation\[\]](#)

Sample

```

var calc = solutionModel.getDataSourceNode("db:/example_data/customers").newCalculation("function
myCalculation() { return 123; }", JSVariable.INTEGER);
var calc2 = solutionModel.getDataSourceNode("db:/example_data/customers").newCalculation("function
myCalculation2() { return '20'; }");
var calc3 = solutionModel.getDataSourceNode("db:/example_data/employees").newCalculation("function
myCalculation3() { return 'Hello World!'; }", JSVariable.TEXT);

var c = solutionModel.getDataSourceNode("db:/example_data/customers").getCalculation("myCalculation");
application.output("Name: " + c.getName() + ", Stored: " + c.isStored());

var allCalcs = solutionModel.getDataSourceNode("db:/example_data/customers").getCalculations();
for (var i = 0; i < allCalcs.length; i++) {
    application.output(allCalcs[i]);
}

```

getDataSource**String** **getDataSource** ()

Get the data source for this node.

Returns**String** - the dataSource**Sample**

```

var nodeDataSource = solutionModel.getDataSourceNode("db:/example_data/customers").getDataSource();

```

getMethod**JSMMethod** **getMethod** (name)

Get an existing foundset method for the datasource node.

Parameters{**String**} name - The name of the method**Returns****JSMMethod****Sample**

```

var method = solutionModel.getDataSourceNode("db:/example_data/orders").newMethod("function doubleSize() {
return 2*getSize(); }");

application.output('Doubled orders for this customer: '+customers_to_orders.doubleSize())

```

getMethods**JSMMethod[]** **getMethods** ()

Gets all the foundset methods for the datasource node.

Returns**JSMMethod[]****Sample**

```

var method = solutionModel.getDataSourceNode("db:/example_data/orders").newMethod("function doubleSize() {
return 2*getSize(); }");

application.output('Doubled orders for this customer: '+customers_to_orders.doubleSize())

```

newCalculation**JSCalculation** **newCalculation** (code)

Creates a new calculation for the given code, the type will be the column where it could be build on (if name is a column name), else it will default to JSVariable.TEXT;

Parameters{**String**} code - The code of the calculation, this must be a full function declaration.

Returns[JSCalculation](#)**Sample**

```

var calc = solutionModel.getDataSourceNode("db:/example_data/customers").newCalculation("function
myCalculation() { return 123; }", JSVariable.INTEGER);
var calc2 = solutionModel.getDataSourceNode("db:/example_data/customers").newCalculation("function
myCalculation2() { return '20'; }");
var calc3 = solutionModel.getDataSourceNode("db:/example_data/employees").newCalculation("function
myCalculation3() { return 'Hello World!'; }", JSVariable.TEXT);

var c = solutionModel.getDataSourceNode("db:/example_data/customers").getCalculation("myCalculation");
application.output("Name: " + c.getName() + ", Stored: " + c.isStored());

var allCalcs = solutionModel.getDataSourceNode("db:/example_data/customers").getCalculations();
for (var i = 0; i < allCalcs.length; i++) {
    application.output(allCalcs[i]);
}

```

newCalculation[JSCalculation](#) **newCalculation** (code, type)

Creates a new calculation for the given code and the type, if it builds on a column (name is a column name) then type will be ignored.

Parameters

[{String}](#) code - The code of the calculation, this must be a full function declaration.
[{Number}](#) type - The type of the calculation, one of the JSVariable types.

Returns[JSCalculation](#)**Sample**

```

var calc = solutionModel.getDataSourceNode("db:/example_data/customers").newCalculation("function
myCalculation() { return 123; }", JSVariable.INTEGER);
var calc2 = solutionModel.getDataSourceNode("db:/example_data/customers").newCalculation("function
myCalculation2() { return '20'; }");
var calc3 = solutionModel.getDataSourceNode("db:/example_data/employees").newCalculation("function
myCalculation3() { return 'Hello World!'; }", JSVariable.TEXT);

var c = solutionModel.getDataSourceNode("db:/example_data/customers").getCalculation("myCalculation");
application.output("Name: " + c.getName() + ", Stored: " + c.isStored());

var allCalcs = solutionModel.getDataSourceNode("db:/example_data/customers").getCalculations();
for (var i = 0; i < allCalcs.length; i++) {
    application.output(allCalcs[i]);
}

```

newMethod[JSMMethod](#) **newMethod** (code)

Creates a new foundset method with the specified code.

Parameters

[{String}](#) code - the specified code for the foundset method

Returns[JSMMethod](#) - a JSMMethod object**Sample**

```

var method = solutionModel.getDataSourceNode("db:/example_data/orders").newMethod("function doubleSize() {
return 2*getSize(); }");

application.output('Doubled orders for this customer: '+customers_to_orders.doubleSize())

```

removeCalculation[Boolean](#) **removeCalculation** (name)

Removes the calculation specified by name.

Parameters

{String} name - the name of the calculation to be removed

Returns

Boolean - true if the removal was successful, false otherwise

Sample

```
var calc1 = solutionModel.getDataSourceNode("db:/example_data/customers").newCalculation("function
myCalculation1() { return 123; }", JSVariable.INTEGER);
var calc2 = solutionModel.getDataSourceNode("db:/example_data/customers").newCalculation("function
myCalculation2() { return '20'; }");

var c = solutionModel.getDataSourceNode("db:/example_data/customers").getCalculation("myCalculation1");
application.output("Name: " + c.getName() + ", Stored: " + c.isStored());

solutionModel.getDataSourceNode("db:/example_data/customers").removeCalculation("myCalculation1");
c = solutionModel.getDataSourceNode("db:/example_data/customers").getCalculation("myCalculation1");
if (c != null) {
    application.output("myCalculation could not be removed.");
}

var allCalcs = solutionModel.getDataSourceNode("db:/example_data/customers").getCalculations();
for (var i = 0; i < allCalcs.length; i++) {
    application.output(allCalcs[i]);
}
```

removeMethod

Boolean removeMethod (name)

Removes the foundset method specified by name.

Parameters

{String} name - the name of the method to be removed

Returns

Boolean - true if the removal was successful, false otherwise

Sample

```
var method1 = solutionModel.getDataSourceNode("db:/example_data/customers").newMethod("function
myFoundsetMethod1() { return 123; }");
var method2 = solutionModel.getDataSourceNode("db:/example_data/customers").newCalculation("function
myFoundsetMethod2() { return '20'; }");

var m = solutionModel.getDataSourceNode("db:/example_data/customers").getMethod("myFoundsetMethod1");
application.output("Name: " + m.getName());

solutionModel.getDataSourceNode("db:/example_data/customers").removeMethod("myFoundsetMethod1");
m = solutionModel.getDataSourceNode("db:/example_data/customers").getCalculation("myFoundsetMethod1");
if (m != null) { application.output("myFoundsetMethod1 could not be removed."); }

var allMethods = solutionModel.getDataSourceNode("db:/example_data/customers").getMethod();
for (var i = 0; i < allMethods; i++)
{
    application.output(allMethods[i]);
}
```
