
Performing an Unattended Installation

The All-In-One installer can also be used to perform unattended installation - for example, as part of an automated process or on machines that do not have a Graphical User Interface (GUI).

Performing an unattended installation requires an installation script. The installation script can be created by executing the All-In-One installer on an environment that does have a GUI as described in [Running the All-In-One Installer](#). The last step in the installer allows for the generation of an automatic installation script.

To perform the unattended installation, open a command line or terminal window and execute the following command:

```
java -jar servoy_installer.jar servoy_install.xml
```

Note that the `servoy_install.xml` saved from previous install run needs to be replaced with the name given to the generated automatic installation script.

The unattended installation can also be performed without the `.xml` file. This will install Servoy with all options checked.

```
java -jar servoy_installer.jar -console
```
