Method Summary

JSComponent	<code>cloneComponent(newName, component)</code>	Makes an exact copy of the given component (JSComponent/JSField/JSLABEL) and gives it a new name.
JSComponent	<code>cloneComponent(newName, component, newParentForm)</code>	Makes an exact copy of the given component (JSComponent/JSField/JSLABEL), gives it a new name and moves it to a new parent form, specified as a parameter.
JSForm	<code>cloneForm(newName, jsForm)</code>	Makes an exact copy of the given form and gives it the new name.
String	<code>createBevelBorder(bevel_type, highlight_outer_color, highlight_inner_color, shadow_outer_color, shadow_inner_color)</code>	Create a bevel border string.
String	<code>createEmptyBorder(top_width, right_width, bottom_width, left_width)</code>	Create an empty border string.
String	<code>createEtchedBorder(bevel_type, highlight_color, shadow_color)</code>	Create an etched border string.
String	<code>createFont(name, style, size)</code>	Create a font string.
String	<code>createLineBorder(thick, color)</code>	Create a line border string.
String	<code>createMatteBorder(top_width, right_width, bottom_width, left_width, color)</code>	Create a matte border string.
String	<code>createPageFormat(width, height, leftmargin, rightmargin, topmargin, bottommargin)</code>	Create a page format string.
String	<code>createPageFormat(width, height, leftmargin, rightmargin, topmargin, bottommargin, orientation)</code>	Create a page format string.
String	<code>createPageFormat(width, height, leftmargin, rightmargin, topmargin, bottommargin, orientation, units)</code>	Create a page format string.
String	<code>createRoundedBorder(top_width, right_width, bottom_width, left_width, top_color, right_color, bottom_color, left_color, rounding_radius, border_style)</code>	Create a special matte border string.
String	<code>createSpecialMatteBorder(top_width, right_width, bottom_width, left_width, top_color, right_color, bottom_color, left_color, rounding_radius, dash_pattern)</code>	Create a special matte border string.
String	<code>createTitledBorder(title_text, font, color, title_justification, title_position)</code>	Create a titled border string.
JSDataSourceNo	<code>getDataSourceNode(dataSource)</code>	
de		Gets the specified data source node and returns information about the form (see JSDataSourceNode node).
JSForm	<code>getForm(name)</code>	Gets the specified form object and returns information about the form (see JSForm node).
JSForm[]	<code>getForms()</code>	Get an array of all forms.
JSForm[]	<code>getForms(datasource)</code>	Get an array of forms, that are all based on datasource/servername.
JSForm[]	<code>getForms(server, tablename)</code>	Get an array of forms, that are all based on datasource/servername and tablename.
JSMethod	<code>getGlobalMethod(scopeName, name)</code>	Gets an existing global method by the specified name.
JSMethod[]	<code>getGlobalMethods()</code>	The list of all global methods.
JSMethod[]	<code>getGlobalMethods(scopeName)</code>	The list of all global methods.
JSVariable	<code>getGlobalVariable(scopeName, name)</code>	Gets an existing global variable by the specified name.
JSVariable[]	<code>getGlobalVariables()</code>	Gets an array of all global variables.
JSVariable[]	<code>getGlobalVariables(scopeName)</code>	Gets an array of all global variables.
JSMedia	<code>getMedia(name)</code>	Gets the specified media object; can be assigned to a button/label.

<code>JSMedia[]</code>	<code>getMediaList()</code> Gets the list of all media objects.
<code>JSRelation</code>	<code>getRelation(name)</code> Gets an existing relation by the specified name and returns a JSRelation Object.
<code>JSRelation[]</code>	<code>getRelations(datasource)</code> Gets an array of all relations; or an array of all global relations if the specified table is NULL.
<code>JSRelation[]</code>	<code>getRelations(servername, tablename)</code> Gets an array of all relations; or an array of all global relations if the specified table is NULL.
<code>String[]</code>	<code>getScopeNames()</code> Gets an array of all scope names used.
<code>JSStyle</code>	<code>getStyle(name)</code> Gets the style specified by the given name.
<code>JSValueList</code>	<code>getValueList(name)</code> Gets an existing valuelist by the specified name and returns a JSValueList Object that can be assigned to a field.
<code>JSValueList[]</code>	<code>getValueLists()</code> Gets an array of all valuelists for the currently active solution.
<code>JSForm</code>	<code>newForm(name, superForm)</code> Creates a new form with the given JSForm as its super form.
<code>JSForm</code>	<code>newForm(name, dataSource, styleName, show_in_menu, width, height)</code> Creates a new JSForm Object.
<code>JSForm</code>	<code>newForm(name, serverName, tableName, styleName, show_in_menu, width, height)</code> Creates a new JSForm Object.
<code>JSMETHOD</code>	<code>newGlobalMethod(scopeName, code)</code> Creates a new global method with the specified code in a scope.
<code>JSVariable</code>	<code>newGlobalVariable(scopeName, name, type)</code> Creates a new global variable with the specified name and number type.
<code>JSMedia</code>	<code>newMedia(name, bytes)</code> Creates a new media object that can be assigned to a label or a button.
<code>JSRelation</code>	<code>newRelation(name, primaryDataSource, foreignDataSource, joinType)</code> Creates a new JSRelation Object with a specified name; includes the primary datasource, foreign datasource and the type of join for the new relation.
<code>JSStyle</code>	<code>newStyle(name, content)</code> Creates a new style with the given css content string under the given name.
<code>JSValueList</code>	<code>newValueList(name, type)</code> Creates a new valuelist with the specified name and number type.
<code>Boolean</code>	<code>removeForm(name)</code> Removes the specified form during the persistent connected client session.
<code>Boolean</code>	<code>removeGlobalMethod(scopeName, name)</code> Removes the specified global method.
<code>Boolean</code>	<code>removeGlobalVariable(scopeName, name)</code> Removes the specified global variable.
<code>Boolean</code>	<code>removeMedia(name)</code> Removes the media item specified by name.
<code>Boolean</code>	<code>removeRelation(name)</code> Removes the relation specified by name.
<code>Boolean</code>	<code>removeStyle(name)</code> Removes the specified style.
<code>Boolean</code>	<code>removeValueList(name)</code> Removes the specified valuelist.
<code>JSForm</code>	<code>revertForm(name)</code> Reverts the specified form to the original (blueprint) version of the form; will result in an exception error if the form is not an original form.
<code>JSMETHOD</code>	<code>wrapMethodWithArguments(method, args)</code> Get a JSMETHOD instance with arguments to be assigned to an event.

Method Details

`cloneComponent`

`JSComponent cloneComponent (newName, component)`

Makes an exact copy of the given component (JSComponent/JSField/JSLABEL) and gives it a new name.

Parameters

`{String} newName - the new name of the cloned component`
`{JSComponent} component - the component to clone`

Returns

`JSComponent - the exact copy of the given component`

Sample

```
// get an existing field to clone.
var field = solutionModel.getForm("formWithField").getField("fieldName");
// make a clone/copy of the field
var clone = solutionModel.cloneComponent("clonedField",field);
```

cloneComponent**JSComponent** **cloneComponent** (newName, component, newParentForm)

Makes an exact copy of the given component (JSComponent/JTextField/JLabel), gives it a new name and moves it to a new parent form, specified as a parameter.

Parameters

{String} newName - the new name of the cloned component
 {JSComponent} component - the component to clone
 {JSForm} newParentForm - the new parent form

Returns

JSComponent - the exact copy of the given component

Sample

```
// get an existing field to clone.
var field = solutionModel.getForm("formWithField").getField("fieldName");
// get the target form for the copied/cloned field
var form = solutionModel.getForm("targetForm");
// make a clone/copy of the field and re parent it to the target form.
var clone = solutionModel.cloneComponent("clonedField",field,form);
// show it
forms["targetForm"].controller.show();
```

cloneForm**JSForm** **cloneForm** (newName, jsForm)

Makes an exact copy of the given form and gives it the new name.

Parameters

{String} newName - the new name for the form clone
 {JSForm} jsForm - the form to be cloned

Returns

JSForm - a JSForm

Sample

```
// get an existing form
var form = solutionModel.getForm("existingForm")
// make a clone/copy from it
var clone = solutionModel.cloneForm("clonedForm", form)
// add a new label to the clone
clone.newLabel("added label",50,50,80,20);
// show it
forms["clonedForm"].controller.show();
```

createBevelBorder**String** **createBevelBorder** (bevel_type, highlight_outer_color, highlight_inner_color, shadow_outer_color, shadow_inner_color)

Create a bevel border string.

Parameters

{Number} bevel_type - bevel border type (SM_BEVELTYPE.RAISED or SM_BEVELTYPE.LOWERED)
 {String} highlight_outer_color - bevel border highlight outer color
 {String} highlight_inner_color - bevel border highlight inner color
 {String} shadow_outer_color - bevel border shadow outer color
 {String} shadow_inner_color - bevel border shadow outer color

Returns

String

Sample

```
var form = solutionModel.getForm("someForm");
form.borderType = solutionModel.createBevelBorder(SM_BEVELTYPE.
RAISED,'#ff0000','#00ff00','#ff0000','#00ff00');
```

createEmptyBorder**String** **createEmptyBorder** (top_width, right_width, bottom_width, left_width)

Create an empty border string.

Parameters

{Number} top_width - top width of empty border in pixels
{Number} right_width - right width of empty border in pixels
{Number} bottom_width - bottom width of empty border in pixels
{Number} left_width - left width of empty border in pixels

Returns**String****Sample**

```
var form = solutionModel.getForm("someForm");
form.borderType = solutionModel.createEmptyBorder(1,1,1,1);
```

createEtchedBorder**String** **createEtchedBorder** (bevel_type, highlight_color, shadow_color)

Create an etched border string.

Parameters

{Number} bevel_type - bevel border type
{String} highlight_color - bevel border highlight color
{String} shadow_color - bevel border shadow color

Returns**String****Sample**

```
var form = solutionModel.getForm("someForm");
form.borderType = solutionModel.createEtchedBorder(SM_BEVELTYPE.RAISED,'#ff0000','#00ff00');
```

createFont**String** **createFont** (name, style, size)

Create a font string.

Parameters

{String} name - the name of the font
{Number} style - the style of the font (PLAIN, BOLD, ITALIC or BOLD+ITALIC)
{Number} size - the font size

Returns**String****Sample**

```
var form = solutionModel.getForm("someForm");
var component = form.getComponent("someComponent")
component.fontType = solutionModel.createFont('Arial',SM_FONTSTYLE.BOLD,14);
```

createLineBorder**String** **createLineBorder** (thick, color)

Create a line border string.

Parameters

{Number} thick - border thickness in pixels
{String} color - color of the line border

Returns**String****Sample**

```
var form = solutionModel.getForm("someForm");
form.borderType = solutionModel.createLineBorder(1,'#ff0000');
```

createMatteBorder**String createMatteBorder (top_width, right_width, bottom_width, left_width, color)**

Create a matte border string.

Parameters

- {Number} top_width - top width of matte border in pixels
- {Number} right_width - right width of matte border in pixels
- {Number} bottom_width - bottom width of matte border in pixels
- {Number} left_width - left width of matte border in pixels
- {String} color - border color

Returns**String****Sample**

```
var form = solutionModel.getForm("someForm");
form.borderType = solutionModel.createMatteBorder(1,1,1,1,"#00ff00");
```

createPageFormat**String createPageFormat (width, height, leftmargin, rightmargin, topmargin, bottommargin)**

Create a page format string.

Note: The unit specified for width, height and all margins MUST be the same.

Parameters

- {Number} width - the specified width of the page to be printed.
- {Number} height - the specified height of the page to be printed.
- {Number} leftmargin - the specified left margin of the page to be printed.
- {Number} rightmargin - the specified right margin of the page to be printed.
- {Number} topmargin - the specified top margin of the page to be printed.
- {Number} bottommargin - the specified bottom margin of the page to be printed.

Returns**String****Sample**

```
var form = solutionModel.getForm("someForm");
form.defaultPageFormat = solutionModel.createPageFormat(612,792,72,72,72,72,SM_ORIENTATION.PORTRAIT,SM_UNITS.PIXELS);
```

createPageFormat**String createPageFormat (width, height, leftmargin, rightmargin, topmargin, bottommargin, orientation)**

Create a page format string.

Note: The unit specified for width, height and all margins MUST be the same.

Parameters

- {Number} width - the specified width of the page to be printed.
- {Number} height - the specified height of the page to be printed.
- {Number} leftmargin - the specified left margin of the page to be printed.
- {Number} rightmargin - the specified right margin of the page to be printed.
- {Number} topmargin - the specified top margin of the page to be printed.
- {Number} bottommargin - the specified bottom margin of the page to be printed.
- {Number} orientation - the specified orientation of the page to be printed; the default is Portrait mode

Returns**String**

Sample

```
var form = solutionModel.getForm("someForm");
form.defaultPageFormat = solutionModel.createPageFormat(612,792,72,72,72,72,SM_ORIENTATION.PORTRAIT,SM_UNITS.
PIXELS);
```

createPageFormat**String** **createPageFormat** (width, height, leftmargin, rightmargin, topmargin, bottommargin, orientation, units)

Create a page format string.

Note: The unit specified for width, height and all margins MUST be the same.

Parameters

- {Number} width - the specified width of the page to be printed.
- {Number} height - the specified height of the page to be printed.
- {Number} leftmargin - the specified left margin of the page to be printed.
- {Number} rightmargin - the specified right margin of the page to be printed.
- {Number} topmargin - the specified top margin of the page to be printed.
- {Number} bottommargin - the specified bottom margin of the page to be printed.
- {Number} orientation - the specified orientation of the page to be printed; the default is Portrait mode
- {Number} units - the specified units for the width and height of the page to be printed; the default is pixels

Returns**String****Sample**

```
var form = solutionModel.getForm("someForm");
form.defaultPageFormat = solutionModel.createPageFormat(612,792,72,72,72,72,SM_ORIENTATION.PORTRAIT,SM_UNITS.
PIXELS);
```

createRoundedBorder**String** **createRoundedBorder** (top_width, right_width, bottom_width, left_width, top_color, right_color, bottom_color, left_color, rounding_radius, border_style)

Create a special matte border string.

Parameters

- {Number} top_width - top width of matte border in pixels
- {Number} right_width - right width of matte border in pixels
- {Number} bottom_width - bottom width of matte border in pixels
- {Number} left_width - left width of matte border in pixels
- {String} top_color - top border color
- {String} right_color - right border color
- {String} bottom_color - bottom border color
- {String} left_color - left border color
- {Number[]} rounding_radius - array with width/height of the arc to round the corners
- {String[]} border_style - the border styles for the four margins(top/left/bottom/left)

Returns**String****Sample**

```
var form = solutionModel.getForm("someForm");
// create a rectangle border (no rounded corners) and continuous line
form.borderType = solutionModel.createSpecialMatteBorder(1,1,1,1,"#00ff00","#00ff00","#00ff00","#00ff00",0,
null);
// create a border with rounded corners and dashed line (25 pixels drawn, then 25 pixels skipped)
// rounding_radius is an array of up to 8 numbers, order is: top-left,top-right,bottom-right,bottom-left
(repeated twice - for width and height)
// form.borderType = solutionModel.createSpecialMatteBorder(1,1,1,1,"#00ff00","#00ff00","#00ff00","#00ff00",
new Array(10,10,10,10),new Array(25,25));
```

createSpecialMatteBorder**String** **createSpecialMatteBorder** (top_width, right_width, bottom_width, left_width, top_color, right_color, bottom_color, left_color, rounding_radius, dash_pattern)

Create a special matte border string.

Parameters

{Number} top_width - top width of matte border in pixels
 {Number} right_width - right width of matte border in pixels
 {Number} bottom_width - bottom width of matte border in pixels
 {Number} left_width - left width of matte border in pixels
 {String} top_color - top border color
 {String} right_color - right border color
 {String} bottom_color - bottom border color
 {String} left_color - left border color
 {Number} rounding_radius - width of the arc to round the corners
 {Number[]} dash_pattern - the dash pattern of border stroke

Returns

String

Sample

```
var form = solutionModel.getForm("someForm");
// create a rectangle border (no rounded corners) and continuous line
form.borderType = solutionModel.createSpecialMatteBorder(1,1,1,1,"#00ff00","#00ff00","#00ff00","#00ff00",0,
null);
// create a border with rounded corners and dashed line (25 pixels drawn, then 25 pixels skipped)
// form.borderType = solutionModel.createSpecialMatteBorder(1,1,1,1,"#00ff00","#00ff00","#00ff00","#00ff00",
10,new Array(25,25));
```

createTitledBorder

String createTitledBorder (title_text, font, color, title_justification, title_position)

Create a titled border string.

Parameters

{String} title_text - the text from border
 {String} font - title text font string
 {String} color - border color
 {Number} title_justification - title text justification
 {Number} title_position - bevel title text position

Returns

String

Sample

```
var form = solutionModel.getForm("someForm");
form.borderType = solutionModel.createTitledBorder('Test',solutionModel.createFont('Arial',SM_FONTSTYLE.PLAIN,10),'#ff0000',SM_TITLEJUSTIFICATION.CENTER,SM_TITLEPOSITION.TOP);
```

getDataSourceNode

JSDatasourceNode getDataSourceNode (dataSource)

Gets the specified data source node and returns information about the form (see JSDatasourceNode node).
 The JSDatasourceNode holds all calculations and foundset methods.

Parameters

{String} dataSource - table data source

Returns

JSDatasourceNode - a JSDatasourceNode

Sample

```
var dsnode = solutionModel.getDataSourceNode('db:/example_data/customers');
var c = dsnode.getCalculation("myCalculation");
application.output("Name: " + c.getName() + ", Stored: " + c.isStored());
```

getForm

JSForm getForm (name)

Gets the specified form object and returns information about the form (see JSForm node).

Parameters

{String} name - the specified name of the form

Returns**JSForm** - a JSForm**Sample**

```
var myForm = solutionModel.getForm('existingFormName');
//get the style of the form (for all other properties see JSForm node)
var styleName = myForm.styleName;
```

getForms**JSForm[] getForms ()**

Get an array of all forms.

Returns**JSForm[]** - an array of JSForm type elements**Sample**

```
var forms = solutionModel.getForms()
for (var i in forms)
    application.output(forms[i].name)
```

getForms**JSForm[] getForms (datasource)**

Get an array of forms, that are all based on datasource/servername.

Parameters{**String**} datasource - the datasource or servername**Returns****JSForm[]** - an array of JSForm type elements**Sample**

```
var forms = solutionModel.getForms(datasource)
for (var i in forms)
    application.output(forms[i].name)
```

getForms**JSForm[] getForms (server, tablename)**

Get an array of forms, that are all based on datasource/servername and tablename.

Parameters{**String**} server - the datasource or servername{**String**} tablename - the tablename**Returns****JSForm[]** - an array of JSForm type elements**Sample**

```
var forms = solutionModel.getForms(datasource,tablename)
for (var i in forms)
    application.output(forms[i].name)
```

getGlobalMethod**JSMETHOD getGlobalMethod (scopeName, name)**

Gets an existing global method by the specified name.

Parameters{**String**} scopeName - the scope in which the method is searched{**String**} name - the name of the specified global method**Returns****JSMETHOD** - a JSMETHOD

Sample

```
var method = solutionModel.getGlobalMethod('globals', 'nameOfGlobalMethod');
if (method != null) application.output(method.code);
```

getGlobalMethods**JSMethod[] getGlobalMethods ()**

The list of all global methods.

Returns

{JSMethod[]} - an array of JSMethod type elements

Sample

```
var methods = solutionModel.getGlobalMethods('globals');
for (var x in methods)
    application.output(methods[x].getName());
```

getGlobalMethods**JSMethod[] getGlobalMethods (scopeName)**

The list of all global methods.

Parameters

{String} scopeName - limit to global methods of specified scope name

Returns

{JSMethod[]} - an array of JSMethod type elements

Sample

```
var methods = solutionModel.getGlobalMethods('globals');
for (var x in methods)
    application.output(methods[x].getName());
```

getGlobalVariable**JSVariable getGlobalVariable (scopeName, name)**

Gets an existing global variable by the specified name.

Parameters

{String} scopeName - the scope in which the variable is searched

{String} name - the specified name of the global variable

Returns

JSVariable - a JSVariable

Sample

```
var globalVariable = solutionModel.getGlobalVariable('globals', 'globalVariableName');
application.output(globalVariable.name + " has the default value of " + globalVariable.defaultValue);
```

getGlobalVariables**JSVariable[] getGlobalVariables ()**

Gets an array of all global variables.

Returns

{JSVariable[]} - an array of JSVariable type elements

Sample

```
var globalVariables = solutionModel.getGlobalVariables('globals');
for (var i in globalVariables)
    application.output(globalVariables[i].name + " has the default value of " + globalVariables[i].defaultValue);
```

getGlobalVariables

JSVariable[] getGlobalVariables (scopeName)

Gets an array of all global variables.

Parameters

{String} scopeName - limit to global vars of specified scope name

Returns

JSVariable[] - an array of JSVariable type elements

Sample

```
var globalVariables = solutionModel.getGlobalVariables('globals');
for (var i in globalVariables)
    application.output(globalVariables[i].name + " has the default value of " + globalVariables[i].defaultValue);
```

getMedia**JSMedia getMedia (name)**

Gets the specified media object; can be assigned to a button/label.

Parameters

{String} name - the specified name of the media object

Returns

JSMedia - a JSMedia element

Sample

```
var myMedia = solutionModel.getMedia('button01.gif')
//now set the imageMedia property of your label or button
//myButton.imageMedia = myMedia
// OR
//myLabel.imageMedia = myMedia
```

getMediaList**JSMedia[] getMediaList ()**

Gets the list of all media objects.

Returns

JSMedia[] - a list with all the media objects.

Sample

```
var mediaList = solutionModel.getMediaList();
if (mediaList.length != 0 && mediaList != null) {
    for (var x in mediaList) {
        application.output(mediaList[x]);
    }
}
```

getRelation**JSRelation getRelation (name)**

Gets an existing relation by the specified name and returns a JSRelation Object.

Parameters

{String} name - the specified name of the relation

Returns

JSRelation - a JSRelation

Sample

```
var relation = solutionModel.getRelation('name');
application.output("The primary server name is " + relation.primaryServerName);
application.output("The primary table name is " + relation.primaryTableName);
application.output("The foreign table name is " + relation.foreignTableName);
application.output("The relation items are " + relation.getRelationItems());
```

getRelations**JSRelation[] getRelations (datasource)**

Gets an array of all relations; or an array of all global relations if the specified table is NULL.

Parameters

{String} datasource - the specified name of the datasource for the specified table

Returns

JSRelation[] - an array of all relations (all elements in the array are of type JSRelation)

Sample

```
var relations = solutionModel.getRelations(datasources.db.my_server.my_table.getDatasource());
if (relations.length != 0)
    for (var i in relations)
        application.output(relations[i].name);
```

getRelations**JSRelation[] getRelations (servername, tablename)**

Gets an array of all relations; or an array of all global relations if the specified table is NULL.

Parameters

{String} servername - the specified name of the server for the specified table

{String} tablename - the specified name of the table

Returns

JSRelation[] - an array of all relations (all elements in the array are of type JSRelation)

Sample

```
var relations = solutionModel.getRelations('server_name', 'table_name');
if (relations.length != 0)
    for (var i in relations)
        application.output(relations[i].name);
```

getScopeNames**String[] getScopeNames ()**

Gets an array of all scope names used.

Returns

String[] - an array of String scope names

Sample

```
var scopeNames = solutionModel.getScopeNames();
for (var name in scopeNames)
    application.output(name);
```

getStyle**JSStyle getStyle (name)**

Gets the style specified by the given name.

Parameters

{String} name - the specified name of the style

Returns

JSStyle - a JSStyle

Sample

```
var style = solutionModel.getStyle('my_existing_style')
style.content = 'combobox { color: #0000ff;font: italic 10pt "Verdana";}'
```

getValueList**JSValueList getValueList (name)**

Gets an existing valuelist by the specified name and returns a JSValueList Object that can be assigned to a field.

Parameters

{String} name - the specified name of the valuelist

Returns

JSValueList - a JSValueList object

Sample

```
var myValueList = solutionModel.getValueList('myValueListHere')
//now set the valueList property of your field
//myField.valuelist = myValueList
```

getValueLists**JSValueList[] getValueLists()**

Gets an array of all valuelists for the currently active solution.

Returns

JSValueList[] - an array of JSValueList objects

Sample

```
var valueLists = solutionModel.getValueLists();
if (valueLists != null && valueLists.length != 0)
    for (var i in valueLists)
        application.output(valueLists[i].name);
```

newForm**JSForm newForm (name, superForm)**

Creates a new form with the given JSForm as its super form.

Parameters

{String} name - The name of the new form

{JSForm} superForm - the super form that will extend from, see JSform.setExtendsForm();

Returns

JSForm - a new JSForm object

Sample

```
//creates 2 forms with elements on them; shows the parent form, waits 2 seconds and shows the child form
var mySuperForm = solutionModel.newForm('mySuperForm', 'db:/my_server/my_table', null, false, 800, 600);
var label1 = mySuperForm.newLabel('LabelName', 20, 20, 120, 30);
label1.text = 'DataProvider';
label1.background = 'red';
mySuperForm.newTextField('myDataProvider', 140, 20, 140, 20);
forms['mySuperForm'].controller.show();
application.sleep(2000);
var mySubForm = solutionModel.newForm('mySubForm', mySuperForm);
var label2 = mySuperForm.newLabel('SubForm Label', 20, 120, 120, 30);
label2.background = 'green';
forms['mySuperForm'].controller.recreateUI();
forms['mySubForm'].controller.show();
```

newForm**JSForm newForm (name, dataSource, styleName, show_in_menu, width, height)**

Creates a new JSForm Object.

NOTE: See the JSForm node for more information about form objects that can be added to the new form.

Parameters

{String} name - the specified name of the form

{String} dataSource - the specified name of the datasource for the specified table

{String} styleName - the specified style

{Boolean} show_in_menu - if true show the name of the new form in the menu; or false for not showing

{Number} width - the width of the form in pixels

{Number} height - the height of the form in pixels

Returns

JSForm - a new JSForm object

Sample

```
var myForm = solutionModel.newForm('newForm', 'db:/my_server/my_table', 'myStyleName', false, 800, 600)
//now you can add stuff to the form (under JSForm node)
//add a label
myForm.newLabel('Name', 20, 20, 120, 30)
//add a "normal" text entry field
myForm.newTextField('dataProviderNameHere', 140, 20, 140,20)
```

newForm

JSForm **newForm** (name, serverName, tableName, styleName, show_in_menu, width, height)
Creates a new JSForm Object.

NOTE: See the JSForm node for more information about form objects that can be added to the new form.

Parameters

- {String} name - the specified name of the form
- {String} serverName - the specified name of the server for the specified table
- {String} tableName - the specified name of the table
- {String} styleName - the specified style
- {Boolean} show_in_menu - if true show the name of the new form in the menu; or false for not showing
- {Number} width - the width of the form in pixels
- {Number} height - the height of the form in pixels

Returns

JSForm - a new JSForm object

Sample

```
var myForm = solutionModel.newForm('newForm', 'my_server', 'my_table', 'myStyleName', false, 800, 600)
//With only a datasource:
//var myForm = solutionModel.newForm('newForm', datasource, 'myStyleName', false, 800, 600)
//now you can add stuff to the form (under JSForm node)
//add a label
myForm.newLabel('Name', 20, 20, 120, 30)
//add a "normal" text entry field
myForm.newTextField('dataProviderNameHere', 140, 20, 140,20)
```

newGlobalMethod

JSMETHOD **newGlobalMethod** (scopeName, code)
Creates a new global method with the specified code in a scope.

Parameters

- {String} scopeName - the scope in which the method is created
- {String} code - the specified code for the global method

Returns

JSMETHOD - a JSMETHOD object

Sample

```
var method = solutionModel.newGlobalMethod('globals', 'function myglobalmethod(){foundset.newRecord()}' )
```

newGlobalVariable

JSVariable **newGlobalVariable** (scopeName, name, type)
Creates a new global variable with the specified name and number type.

NOTE: The global variable number type is based on the value assigned from the SolutionModel-JSVariable node; for example: JSVariable.INTEGER.

Parameters

- {String} scopeName - the scope in which the variable is created
- {String} name - the specified name for the global variable
- {Number} type - the specified number type for the global variable

Returns

JSVariable - a JSVariable object

Sample

```
var myGlobalVariable = solutionModel.newGlobalVariable('globals', 'newGlobalVariable', JSVariable.INTEGER);
myGlobalVariable.defaultValue = 12;
//myGlobalVariable.defaultValue = "{a:'First letter',b:'Second letter'}" // an js object, type must be media.
//myGlobalVariable.defaultValue = '"some text"'; // Use two pairs of quotes if you want to assign a String
as default value.
```

newMedia**JSMedia** **newMedia** (name, bytes)

Creates a new media object that can be assigned to a label or a button.

Parameters

{String} name - The name of the new media
 {byte[]} bytes - The content

Returns**JSMedia** - a JSMedia object**Sample**

```
var myMedia = solutionModel.newMedia('button01.gif',bytes)
//now set the imageMedia property of your label or button
//myButton.imageMedia = myMedia
// OR
//myLabel.imageMedia = myMedia
```

newRelation**JSRelation** **newRelation** (name, primaryDataSource, foreignDataSource, joinType)

Creates a new JSRelation Object with a specified name; includes the primary datasource, foreign datasource and the type of join for the new relation.

Parameters

{String} name - the specified name of the new relation
 {String} primaryDataSource - the specified name of the primary datasource
 {String} foreignDataSource - the specified name of the foreign datasource
 {Number} joinType - the type of join for the new relation; JSRelation.INNER_JOIN, JSRelation.LEFT_OUTER_JOIN

Returns**JSRelation** - a JSRelation object**Sample**

```
var rel = solutionModel.newRelation('myRelation', myPrimaryDataSource, myForeignDataSource, JSRelation.
INNER_JOIN);
application.output(rel.getRelationItems());
```

newStyle**JSSyle** **newStyle** (name, content)

Creates a new style with the given css content string under the given name.

NOTE: Will throw an exception if a style with that name already exists.

Parameters

{String} name - the name of the new style
 {String} content - the css content of the new style

Returns**JSSyle** - a JSSyle object

Sample

```

var form = solutionModel.newForm('myForm','db:/my_server/my_table',null,true,1000,800);
if (form.transparent == false)
{
    var style = solutionModel.newStyle('myStyle','form { background-color: yellow; }');
    style.text = style.text + 'field { background-color: blue; }';
    form.styleName = 'myStyle';
}
var field = form.newField('columnTextDataProvider',JSField.TEXT_FIELD,100,100,100,50);
forms['myForm'].controller.show();

```

newValueList**JSValueList** **newValueList** (name, type)

Creates a new valuelist with the specified name and number type.

Parameters

{[String](#)} name - the specified name for the valuelist
 {[Number](#)} type - the specified number type for the valuelist; may be JSValueList.CUSTOM_VALUES, JSValueList.DATABASE_VALUES, JSValueList.EMPTY_VALUE_ALWAYS, JSValueList.EMPTY_VALUE_NEVER

Returns[JSValueList](#) - a JSValueList object**Sample**

```

var v11 = solutionModel.newValueList("customText",JSValueList.CUSTOM_VALUES);
v11.customValues = "customvalue1\ncustomvalue2";
var v12 = solutionModel.newValueList("customid",JSValueList.CUSTOM_VALUES);
v12.customValues = "customvalue1|1\ncustomvalue2|2";
var form = solutionModel.newForm("customValueListForm",controller.getDataSource(),null,true,300,300);
var combo1 = form.newComboBox("scopes.globals.text",10,10,120,20);
combo1.valuelist = v11;
var combo2 = form.newComboBox("scopes.globals.id",10,60,120,20);
combo2.valuelist = v12;

```

removeForm**Boolean** **removeForm** (name)

Removes the specified form during the persistent connected client session.

NOTE: Make sure you call history.remove first in your Servoy method (script).

Parameters{[String](#)} name - the specified name of the form to remove**Returns**[Boolean](#) - true if form has been removed, false if form could not be removed**Sample**

```

//first remove it from the current history, to destroy any active form instance
var success = history.removeForm('myForm')
//removes the named form from this session, please make sure you called history.remove() first
if(success)
{
    solutionModel.removeForm('myForm')
}

```

removeGlobalMethod**Boolean** **removeGlobalMethod** (scopeName, name)

Removes the specified global method.

Parameters{[String](#)} scopeName - the scope in which the method is declared{[String](#)} name - the name of the global method to be removed**Returns**[Boolean](#) - true if the removal was successful, false otherwise

Sample

```

var m1 = solutionModel.newGlobalMethod('globals', 'function myglobalmethod1(){application.output("Global Method 1");}');
var m2 = solutionModel.newGlobalMethod('globals', 'function myglobalmethod2(){application.output("Global Method 2");}');

var success = solutionModel.removeGlobalMethod('globals', 'myglobalmethod1');
if (success == false) application.output('!!! myglobalmethod1 could not be removed !!!');

var list = solutionModel.getGlobalMethods('globals');
for (var i = 0; i < list.length; i++) {
    application.output(list[i].code);
}

```

removeGlobalVariable**Boolean removeGlobalVariable (scopeName, name)**

Removes the specified global variable.

Parameters

{[String](#)} scopeName - the scope in which the variable is declared
 {[String](#)} name - the name of the global variable to be removed

Returns{[Boolean](#)} - true if the removal was successful, false otherwise**Sample**

```

var v1 = solutionModel.newGlobalVariable('globals', 'globalVar1', JSVariable.INTEGER);
var v2 = solutionModel.newGlobalVariable('globals', 'globalVar2', JSVariable.TEXT);

var success = solutionModel.removeGlobalVariable('globals', 'globalVar1');
if (success == false) application.output('!!! globalVar1 could not be removed !!!');

var list = solutionModel.getGlobalVariables('globals');
for (var i = 0; i < list.length; i++) {
    application.output(list[i].name + '[' + list[i].variableType + ']: ' + list[i].variableType);
}

```

removeMedia**Boolean removeMedia (name)**

Removes the media item specified by name.

Parameters{[String](#)} name - the name of the media item to be removed**Returns**{[Boolean](#)} - true if the removal was successful, false otherwise

Sample

```

var bytes1 = plugins.file.readFile('D:/Imgs/image1.png');
var image1 = solutionModel.newMedia('image1.png', bytes1);
var bytes2 = plugins.file.readFile('D:/Imgs/image2.jpg');
var image2 = solutionModel.newMedia('image2.jpg', bytes2);
var bytes3 = plugins.file.readFile('D:/Imgs/image3.jpg');
var image3 = solutionModel.newMedia('image3.jpg', bytes3);

var f = solutionModel.newForm("newForm", databaseManager.getDataSource('example_data', 'orders'), null, false, 500, 350);
var l = f.newLabel('', 20, 70, 300, 200);
l.imageMedia = image1;
l.borderType = solutionModel.createLineBorder(4, '#ff0000');
forms["newForm"].controller.show();

var status = solutionModel.removeMedia('image1.jpg');
if (status) application.output("image1.png has been removed");
else application.output("image1.png has not been removed");

var mediaList = solutionModel.getMediaList();
for (var i = 0; i < mediaList.length; i++) {
    application.output(mediaList[i].getName() + ":" + mediaList[i].mimeType);
}

```

removeRelation**Boolean removeRelation (name)**

Removes the relation specified by name.

Parameters{[String](#)} name - the name of the relation to be removed**Returns**[Boolean](#) - true if the removal was successful, false otherwise**Sample**

```

var success = solutionModel.removeRelation('myRelation');
if (success) { application.output("Relation has been removed");}
else {application.output("Relation could not be removed");}

```

removeStyle**Boolean removeStyle (name)**

Removes the specified style.

Parameters{[String](#)} name - the name of the style to be removed**Returns**[Boolean](#) - true if the removal was successful, false otherwise**Sample**

```

var s = solutionModel.newStyle("smStyle1", 'form { background-color: yellow; }');
var status = solutionModel.removeStyle("smStyle1");
if (status == false) application.output("Could not remove style.");
else application.output("Style removed.");

```

removeValueList**Boolean removeValueList (name)**

Removes the specified valuelist.

Parameters{[String](#)} name - name of the valuelist to be removed**Returns**[Boolean](#) - true if the removal was successful, false otherwise

Sample

```

var vlName = "customValueList";
var vl = solutionModel.newValueList(vlName, JSValueList.CUSTOM_VALUES);
vl.customValues = "customvalue1\ncustomvalue2";

var status = solutionModel.removeValueList(vlName);
if (status) application.output("Removal has been done.");
else application.output("ValueList not removed.");

var vls = solutionModel.getValueLists();
if (vls != null) {
    for (var i = 0; i < vls.length; i++) {
        application.output(vls[i]);
    }
    application.output("");
}

```

revertForm**JSForm** **revertForm** (name)

Reverts the specified form to the original (blueprint) version of the form; will result in an exception error if the form is not an original form.

NOTE: Make sure you call history.remove first in your Servoy method (script) or call form.controller.recreateUI() before the script ends.

Parameters

{String} name - the specified name of the form to revert

Returns

JSForm - a JSForm object

Sample

```

// revert the form to the original solution form, removing any changes done to it through the solution model.
var revertedForm = solutionModel.revertForm('myForm')
// add a label on a random place.
revertedForm.newLabel("MyLabel",Math.random()*100,Math.random()*100,80,20);
// make sure that the ui is up to date.
forms.myForm.controller.recreateUI();

```

wrapMethodWithArguments**JSMETHOD** **wrapMethodWithArguments** (method, args)

Get a JSMETHOD instance with arguments to be assigned to an event.

Parameters

{JSMETHOD} method - JSMETHOD to be assigned to an event
 {Object...} args - positional arguments

Returns

JSMETHOD - a JSMETHOD

Sample

```

var str = "John's Bookstore"
var form = solutionModel.getForm('orders')
var button = form.getButton('abutton')
var method = form.getFormMethod('doit') // has 4 arguments: event (fixed), boolean, number and string
// string arguments have to be quoted, they are interpreted before the method is called
var quotedString = '"' + utils.stringReplace(str, "'", "\\'") + "'"
// list all arguments the method has, use nulls for fixed arguments (like event)
button.onAction = solutionModel.wrapMethodWithArguments(method, [null, true, 42, quotedString])

```
