QBColumn

Property Summary

QBFunction	abs Create abs(column) expression
QBSort	asc Create an ascending sort expression
QBAggregate	avg Create an aggregate expression.
QBFunction	bit_length Create bit_length(column) expression
QBFunction	ceil Create ceil(column) expression
QBAggregate	count Create an aggregate expression.
QBFunction	day Extract day from date
QBSort	desc Create an descending sort expression
QBFunction	floor Create floor(column) expression
QBFunction	hour Extract hour from date
QBCondition	isNull Compare column with null.
QBFunction	len Create length(column) expression
QBFunction	lower Create lower(column) expression
QBAggregate	max Create an aggregate expression.
QBAggregate	min Create an aggregate expression.
QBFunction	minute Extract minute from date
QBFunction	month Extract month from date
QBColumn	not Create a negated condition.
QBTableClause	parent Get query builder parent table clause, this may be a query or a join clause.
QBSelect	root Get query builder parent.
QBFunction	round Create round(column) expression
QBFunction	second Extract second from date
QBFunction	sqrt Create sqrt(column) expression
QBAggregate	sum Create an aggregate expression.
QBFunction	trim Create trim(column) expression
QBFunction	upper Create upper(column) expression
QBFunction	year Extract year from date

Method Summary

QBCondition	between(value1, value2) Compare column to a range of 2 values or other columns.
QBFunction	cast(type) Create cast(column, type) expression
QBFunction	concat(arg) Concatename with value

QBFunction	divide(arg) Divide by value
QBCondition	eq(value) Compare column with a value or another column.
QBCondition	ge(value) Compare column with a value or another column.
QBCondition	gt(value) Compare column with a value or another column.
QBCondition	isin(query) Compare column with subquery result.
QBCondition	isin(values) Compare column with values.
QBCondition	le(value) Compare column with a value or another column.
QBCondition	like(pattern) Compare column with a value or another column.
QBCondition	like(pattern, escape) Compare column with a value or another column.
QBFunction	locate(arg) Create locate(arg) expression
QBFunction	locate(arg, start) Create locate(arg, start) expression
QBCondition	lt(value) Compare column with a value or another column.
QBFunction	minus(arg) Subtract value
QBFunction	mod(arg) Create mod(arg) expression
QBFunction	multiply(arg) Multiply with value
QBFunction	nullif(arg) Create nullif(arg) expression
QBFunction	plus(arg) Add up value
QBFunction	substring(pos) Create substring(pos) expression
QBFunction	substring(pos, len) Create substring(pos, len) expression

Property Details

abs

Create abs(column) expression

Returns

QBFunction

Sample

```
query.result.add(query.columns.custname.abs)
```

asc

Create an ascending sort expression

Returns

QBSort

Sample

```
/** @type {QBSelect<db:/example_data/orders>} */
var query = databaseManager.createSelect('db:/example_data/orders')
query.sort
.add(query.joins.orders_to_order_details.columns.quantity.asc)
.add(query.columns.companyid)
foundset.loadRecords(query)
```

avg

Create an aggregate expression.

Returns

QBAggregate

Sample

```
/** @type {QBSelect<db:/example_data/orders>} */
        var query = databaseManager.createSelect('db:/example_data/orders')
        query.groupBy.addPk() // have to group by on pk when using having-conditions in (foundset) pk queries
        .root.having.add(query.joins.orders_to_order_details.columns.quantity.avg.eq(1))
        foundset.loadRecords(query)
```

bit_length

Create bit_length(column) expression

Returns

QBFunction

Sample

```
query.result.add(query.columns.custname.bit_length)
```

ceil

Create ceil(column) expression

Returns

QBFunction

Sample

```
query.result.add(query.columns.mycol.ceil)
```

count

Create an aggregate expression.

Returns

QBAggregate

Sample

```
/** @type {QBSelect<db:/example_data/orders>} */
        var query = databaseManager.createSelect('db:/example_data/orders')
        query.groupBy.addPk() // have to group by on pk when using having-conditions in (foundset) pk queries
        .root.having.add(query.joins.orders_to_order_details.columns.quantity.count.eq(0))
        foundset.loadRecords(query)
```

day

Extract day from date

Returns

QBFunction

Sample

```
query.result.add(query.columns.mydatecol.day)
```

desc

Create an descending sort expression

Returns

QBSort

Sample

```
/** @type {QBSelect<db:/example_data/orders>} */
var query = databaseManager.createSelect('db:/example_data/orders')
query.sort
.add(query.joins.orders_to_order_details.columns.quantity.desc)
.add(query.columns.companyid)
foundset.loadRecords(query)
```

floor

Create floor(column) expression

Returns

QBFunction

Sample

```
query.result.add(query.columns.mycol.floor)
```

hour

Extract hour from date

Returns

QBFunction

Sample

```
query.result.add(query.columns.mydatecol.hour)
```

isNull

Compare column with null.

Returns

QBCondition

Sample

```
query.where.add(query.columns.flag.isNull)
```

len

Create length(column) expression

Returns

QBFunction

Sample

```
query.result.add(query.columns.custname.len)
```

lower

Create lower(column) expression

Returns

QBFunction

Sample

```
query.result.add(query.columns.custname.lower)
```

max

Create an aggregate expression.

Returns

QBAggregate

Sample

```
/** @type {QBSelect<db:/example_data/orders>} */
        var query = databaseManager.createSelect('db:/example_data/orders')
        query.groupBy.addPk() // have to group by on pk when using having-conditions in (foundset) pk queries
        .root.having.add(query.joins.orders_to_order_details.columns.quantity.count.max(10))
        foundset.loadRecords(query)
```

min

Create an aggregate expression.

Returns

QBAggregate

Sample

```
/** @type {QBSelect<db:/example_data/orders>} */
        var query = databaseManager.createSelect('db:/example_data/orders')
        query.groupBy.addPk() // have to group by on pk when using having-conditions in (foundset) pk queries
        .root.having.add(query.joins.orders_to_order_details.columns.quantity.count.min(10))
        foundset.loadRecords(query)
```

minute

Extract minute from date

Returns

QBFunction

Sample

```
query.result.add(query.columns.mydatecol.minute)
```

month

Extract month from date

Returns

QBFunction

Sample

```
query.result.add(query.columns.mydatecol.month)
```

not

Create a negated condition.

Returns

QBColumn

Sample

```
query.where.add(query.columns.flag.not.eq(1))
```

parent

Get query builder parent table clause, this may be a query or a join clause.

Returns

QBTableClause

Sample

```
/** @type {QBSelect<db:/example_data/person>} */
        var query = databaseManager.createSelect('db:/example_data/person')
        query.where.add(query.joins.person_to_parent.joins.person_to_parent.columns.name.eq('john'))
        foundset.loadRecords(query)
```

root

Get query builder parent.

Returns

QBSelect

Sample

```
/** @type {QBSelect<db:/example_data/order_details>} */
        var subquery = databaseManager.createSelect('db:/example_data/order_details')

 /** @type {QBSelect<db:/example_data/orders>} */
        var query = databaseManager.createSelect('db:/example_data/orders')
        query.where.add(query
                .or
                        .add(query.columns.order_id.not.isin([1, 2, 3]))

                        .add(query.exists(
                                        subquery.where.add(subquery.columns.orderid.eq(query.columns.
order_id)).root
                        ))
                )

        foundset.loadRecords(query)
```

round

Create round(column) expression

Returns

QBFunction

Sample

```
query.result.add(query.columns.mycol.round)
```

second

Extract second from date

Returns

QBFunction

Sample

```
query.result.add(query.columns.mydatecol.second)
```

sqrt

Create sqrt(column) expression

Returns

QBFunction

Sample

```
query.result.add(query.columns.custname.sqrt)
```

sum

Create an aggregate expression.

Returns

QBAggregate

Sample

```
/** @type {QBSelect<db:/example_data/orders>} */
        var query = databaseManager.createSelect('db:/example_data/orders')
        query.groupBy.addPk() // have to group by on pk when using having-conditions in (foundset) pk queries
        .root.having.add(query.joins.orders_to_order_details.columns.quantity.count.sum(10))
        foundset.loadRecords(query)
```

trim

Create trim(column) expression

Returns

QBFunction

Sample

```
query.result.add(query.columns.custname.trim)
```

upper

Create upper(column) expression

Returns

QBFunction

Sample

```
query.result.add(query.columns.custname.upper)
```

year

Extract year from date

Returns

QBFunction

Sample

```
query.result.add(query.columns.mydatecol.year)
```

Method Details

between

QBCondition **between** (value1, value2)

Compare column to a range of 2 values or other columns.

Parameters

{Object} value1
{Object} value2

Returns

QBCondition

Sample

```
query.where.add(query.columns.flag.between(0, 5))
```

cast

QBFunction **cast** (type)

Create cast(column, type) expression

Parameters

{String} type - string type, see QUERY_COLUMN_TYPES

Returns

QBFunction

Sample

```
query.result.add(query.columns.mycol.cast(QUERY_COLUMN_TYPES.TYPE_INTEGER))
```

concat

QBFunction **concat** (arg)

Concatename with value

Parameters

{Object} arg - valeu to concatenate with

Returns

QBFunction

Sample

```
query.result.add(query.columns.firstname.concat(' ').concat(query.columns.lastname))
```

divide

QBFunction **divide** (arg)

Divide by value

Parameters

{Object} arg - nr to divide by

Returns

QBFunction

Sample

```
query.result.add(query.columns.mycol.divide(2))
```

eq

QBCondition **eq** (value)

Compare column with a value or another column.
Operator: equals

Parameters

{Object} value

Returns

QBCondition

Sample

```
query.where.add(query.columns.flag.eq(1))
```

ge

QBCondition **ge** (value)

Compare column with a value or another column.
Operator: greaterThanOrEqual

Parameters

{Object} value

Returns

QBCondition

Sample

```
query.where.add(query.columns.flag.ge(2))
```

gt

QBCondition **gt** (value)

Compare column with a value or another column.
Operator: greaterThan

Parameters

{Object} value

Returns

QBCondition

Sample

```
query.where.add(query.columns.flag.gt(0))
```

isin

QBCondition **isin** (query)

Compare column with subquery result.

Parameters

{QBPart} query - subquery

Returns

QBCondition

Sample

```
query.where.add(query.columns.flag.isin(query2))
```

isin

QBCondition **isin** (values)

Compare column with values.

Parameters

{Object[]} values - array of values

Returns

QBCondition

Sample

```
query.where.add(query.columns.flag.isin([1, 5, 99]))
```

le

QBCondition **le** (value)

Compare column with a value or another column.
Operator: lessThanOrEqual

Parameters

{Object} value

Returns

QBCondition

Sample

```
query.where.add(query.columns.flag.le(2))
```

like

QBCondition **like** (pattern)

Compare column with a value or another column.
Operator: like

Parameters

{String} pattern - the string value of the pattern

Returns

QBCondition

Sample

```
query.where.add(query.columns.companyname.like('Serv%'))
```

like

QBCondition **like** (pattern, escape)

Compare column with a value or another column.
Operator: like, with escape character

Parameters

{String} pattern - the string value of the pattern
{String} escape - the escape char

Returns

QBCondition

Sample

```
query.where.add(query.columns.companyname.like('X_%', '_'))
```

locate

QBFunction **locate** (arg)

Create locate(arg) expression

Parameters

{Object} arg - string to locate

Returns

QBFunction

Sample

```
query.result.add(query.columns.mycol.locate('sample'))
```

locate

QBFunction **locate** (arg, start)

Create locate(arg, start) expression

Parameters

{Object} arg - string to locate
{Number} start - start pos

Returns

QBFunction

Sample

```
query.result.add(query.columns.mycol.locate('sample', 5))
```

lt

QBCondition **lt** (value)

Compare column with a value or another column.
Operator: lessThan

Parameters

{Object} value

Returns

QBCondition

Sample

```
query.where.add(query.columns.flag.lt(99))
```

minus

QBFunction **minus** (arg)

Subtract value

Parameters

{Object} arg - nr to subtract

Returns

QBFunction

Sample

```
query.result.add(query.columns.mycol.minus(2))
```

mod

QBFunction **mod** (arg)

Create mod(arg) expression

Parameters

{Object} arg - mod arg

Returns

QBFunction

Sample

```
query.result.add(query.columns.mycol.mod(2))
```

multiply

QBFunction **multiply** (arg)

Multiply with value

Parameters

{Object} arg - nr to multiply with

Returns

QBFunction

Sample

```
query.result.add(query.columns.mycol.multiply(2))
```

nullif

QBFunction **nullif** (arg)

Create nullif(arg) expression

Parameters

{Object} arg - object to compare

Returns

QBFunction

Sample

```
query.result.add(query.columns.mycol.nullif('none'))
```

plus

QBFunction **plus** (arg)

Add up value

Parameters

{Object} arg - nr to add

Returns

QBFunction

Sample

```
query.result.add(query.columns.mycol.plus(2))
```

substring

QBFunction **substring** (pos)

Create substring(pos) expression

Parameters

{Number} pos

Returns

QBFunction

Sample

```
query.result.add(query.columns.mycol.substring(3))
```

substring

QBFunction **substring** (pos, len)

Create substring(pos, len) expression

Parameters

{Number} pos
{Number} len

Returns

QBFunction

Sample

```
query.result.add(query.columns.mycol.substring(3, 2))
```
