

# window

## Return Types

[CheckBox](#) [Menu](#) [MenuBar](#) [MenuItem](#) [Popup](#) [RadioButton](#) [ToolBar](#)

## Method Summary

ToolBar	<a href="#">addToolBar(window, name)</a>
	Creates and returns a toolbar for a specific window.
ToolBar	<a href="#">addToolBar(window, name, row)</a>
	Creates and returns a toolbar for a specific window.
ToolBar	<a href="#">addToolBar(window, name, displayName)</a>
	Creates and returns a toolbar for a specific window.
ToolBar	<a href="#">addToolBar(window, name, displayName, row)</a>
	Creates and returns a toolbar for a specific window.
ToolBar	<a href="#">addToolBar(name)</a>
	Add a toolbar.
ToolBar	<a href="#">addToolBar(name, row)</a>
	Add a toolbar.
ToolBar	<a href="#">addToolBar(name, displayName)</a>
	Add a toolbar.
ToolBar	<a href="#">addToolBar(name, displayName, row)</a>
	Add a toolbar.
void	<a href="#">cancelFormPopup()</a>
	Close the current form popup panel without assigning a value to the configured data provider.
void	<a href="#">closeFormPopup(retval)</a>
	Close the current form popup panel and assign the value to the configured data provider.
Popup	<a href="#">createPopupMenu()</a>
	Creates a new popup menu that can be populated with items and displayed.
Boolean	<a href="#">createShortcut(shortcut, methodName)</a>
	Create a shortcut.
Boolean	<a href="#">createShortcut(shortcut, methodName, arguments)</a>
	Create a shortcut.
Boolean	<a href="#">createShortcut(shortcut, methodName, contextFilter)</a>
	Create a shortcut.
Boolean	<a href="#">createShortcut(shortcut, methodName, contextFilter, arguments)</a>
	Create a shortcut.
Boolean	<a href="#">createShortcut(shortcut, method)</a>
	Create a shortcut.
Boolean	<a href="#">createShortcut(shortcut, method, arguments)</a>
	Create a shortcut.
Boolean	<a href="#">createShortcut(shortcut, method, contextFilter)</a>
	Create a shortcut.
Boolean	<a href="#">createShortcut(shortcut, method, contextFilter, arguments)</a>
	Create a shortcut.
MenuBar	<a href="#">getMenuBar()</a>
	Get the menubar of the main window, or of a named window.
MenuBar	<a href="#">getMenuBar(windowName)</a>
	Get the menubar of the main window, or of a named window.
ToolBar	<a href="#">getToolBar(window, name)</a>
	Get the toolbar of a specific window from the toolbar panel by name.
ToolBar	<a href="#">getToolBar(name)</a>
	Get the toolbar from the toolbar panel by name.
String[]	<a href="#">getToolbarNames()</a>
	Get all toolbar names from the toolbar panel.
String[]	<a href="#">getToolbarNames(window)</a>
	Get all toolbar names from the toolbar panel of a specific window.
void	<a href="#">maximize()</a>
	Maximize the current window or the window with the specified name (Smart client only).
void	<a href="#">maximize(windowName)</a>
	Maximize the current window or the window with the specified name (Smart client only).
Boolean	<a href="#">removeShortcut(shortcut)</a>
	Remove a shortcut.
Boolean	<a href="#">removeShortcut(shortcut, contextFilter)</a>
	Remove a shortcut.
void	<a href="#">removeToolBar(window, name)</a>
	Remove the toolbar from the toolbar panel of a specific window.

---

```

void      removeToolBar(name)
Remove the toolbar from the toolbar panel.

void      setFullScreen(full)
Bring the window into/out of fullscreen mode.

void      setStatusBarVisible(visible)
Show or hide the statusbar.

void      setToolBarAreaVisible(visible)
Show or hide the toolbar area.

void      showFormPopup(elementToShowRelatedTo, form, scope, dataproviderID)
Show a form as popup panel, where the closeFormPopup can pass return a value to a dataprovider in the specified scope.

void      showFormPopup(elementToShowRelatedTo, form, scope, dataproviderID, width, height)
Show a form as popup panel, where the closeFormPopup can pass return a value to a dataprovider in the specified scope.

```

## Method Details

### **addToolBar**

**ToolBar addToolBar (window, name)**  
Creates and returns a toolbar for a specific window.

#### Parameters

{JSWindow} window  
{String} name - the name by which this toolbar is identified in code. If display name is missing, name will be used as displayName as well.

#### Returns

ToolBar

#### Sample

```

// Note: method addToolBar only works in the smart client.

// create a window
var win = application.createWindow("myWindow", JSWindow.WINDOW);

// add a toolbar with only a name
var toolbar0 = plugins.window.addToolBar(win, "toolbar_0");
toolbar0.addButton("click me 0", callback_function);

// add a toolbar with a name and the row you want it to show at
// row number starts at 0
var toolbar1 = plugins.window.addToolBar(win, "toolbar_1", 2);
toolbar1.addButton("click me 1", callback_function);

// add a toolbar with a name and display name
var toolbar2 = plugins.window.addToolBar(win, "toolbar_2", "toolbar_2_internal_name");
toolbar2.addButton("click me 2", callback_function);

// add a toolbar with a name, display name and the row you want the
// toolbar to show at. row number starts at 0
var toolbar3 = plugins.window.addToolBar(win, "toolbar_3", "toolbar_3_internal_name", 3);
toolbar3.addButton("click me 3", callback_function);

win.show(forms.Myform)

```

### **addToolBar**

**ToolBar addToolBar (window, name, row)**  
Creates and returns a toolbar for a specific window.

#### Parameters

{JSWindow} window  
{String} name - the name by which this toolbar is identified in code. If display name is missing, name will be used as displayName as well.  
{Number} row - the row inside the toolbar panel where this toolbar is to be added.

#### Returns

ToolBar

**Sample**

```
// Note: method addToolBar only works in the smart client.

// create a window
var win = application.createWindow("myWindow", JSWindow.WINDOW);

// add a toolbar with only a name
var toolbar0 = plugins.window.addToolBar(win, "toolbar_0");
toolbar0.addButton("click me 0", callback_function);

// add a toolbar with a name and the row you want it to show at
// row number starts at 0
var toolbar1 = plugins.window.addToolBar(win, "toolbar_1", 2);
toolbar1.addButton("click me 1", callback_function);

// add a toolbar with a name and display name
var toolbar2 = plugins.window.addToolBar(win, "toolbar_2", "toolbar_2_internal_name");
toolbar2.addButton("click me 2", callback_function);

// add a toolbar with a name, display name and the row you want the
// toolbar to show at. row number starts at 0
var toolbar3 = plugins.window.addToolBar(win, "toolbar_3", "toolbar_3_internal_name", 3);
toolbar3.addButton("click me 3", callback_function);

win.show(forms.Myform)
```

**addToolBar****ToolBar** **addToolBar** (window, name, displayname)

Creates and returns a toolbar for a specific window.

**Parameters**

{JSWindow} window  
 {String} name - the name by which this toolbar is identified in code  
 {String} displayname - the name by which this toolbar will be identified in the UI. (for example in the toolbar panel's context menu)

**Returns****ToolBar****Sample**

```
// Note: method addToolBar only works in the smart client.

// create a window
var win = application.createWindow("myWindow", JSWindow.WINDOW);

// add a toolbar with only a name
var toolbar0 = plugins.window.addToolBar(win, "toolbar_0");
toolbar0.addButton("click me 0", callback_function);

// add a toolbar with a name and the row you want it to show at
// row number starts at 0
var toolbar1 = plugins.window.addToolBar(win, "toolbar_1", 2);
toolbar1.addButton("click me 1", callback_function);

// add a toolbar with a name and display name
var toolbar2 = plugins.window.addToolBar(win, "toolbar_2", "toolbar_2_internal_name");
toolbar2.addButton("click me 2", callback_function);

// add a toolbar with a name, display name and the row you want the
// toolbar to show at. row number starts at 0
var toolbar3 = plugins.window.addToolBar(win, "toolbar_3", "toolbar_3_internal_name", 3);
toolbar3.addButton("click me 3", callback_function);

win.show(forms.Myform)
```

**addToolBar****ToolBar** **addToolBar** (window, name, displayname, row)

Creates and returns a toolbar for a specific window.

**Parameters**

{JSWindow} window  
 {String} name - the name by which this toolbar is identified in code.  
 {String} displayname - the name by which this toolbar will be identified in the UI. (for example in the toolbar panel's context menu)  
 {Number} row - the row inside the toolbar panel where this toolbar is to be added.

**Returns**

[ToolBar](#)

**Sample**

```
// Note: method addToolBar only works in the smart client.

// create a window
var win = application.createWindow("myWindow", JSWindow.WINDOW);

// add a toolbar with only a name
var toolbar0 = plugins.window.addToolBar(win, "toolbar_0");
toolbar0.addButton("click me 0", callback_function);

// add a toolbar with a name and the row you want it to show at
// row number starts at 0
var toolbar1 = plugins.window.addToolBar(win, "toolbar_1", 2);
toolbar1.addButton("click me 1", callback_function);

// add a toolbar with a name and display name
var toolbar2 = plugins.window.addToolBar(win, "toolbar_2", "toolbar_2_internal_name");
toolbar2.addButton("click me 2", callback_function);

// add a toolbar with a name, display name and the row you want the
// toolbar to show at. row number starts at 0
var toolbar3 = plugins.window.addToolBar(win, "toolbar_3", "toolbar_3_internal_name", 3);
toolbar3.addButton("click me 3", callback_function);

win.show(forms.Myform)
```

**addToolBar**

[ToolBar](#) **addToolBar** (name)

Add a toolbar.

**Parameters**

{String} name - the name by which this toolbar is identified in code. If display name is missing, name will be used as displayName as well.

**Returns**

[ToolBar](#)

**Sample**

```
// Note: method addToolBar only works in the smart client.

// add a toolbar with only a name
var toolbar0 = plugins.window.addToolBar("toolbar_0");
toolbar0.addButton("click me 0", feedback_button);

// add a toolbar with a name and the row you want it to show at
// row number starts at 0
var toolbar1 = plugins.window.addToolBar("toolbar_1", 2);
toolbar1.addButton("click me 1", feedback_button);

// add a toolbar with a name and display name
var toolbar2 = plugins.window.addToolBar("toolbar_2", "toolbar_2_internal_name");
toolbar2.addButton("click me 2", feedback_button);

// add a toolbar with a name, display name and the row you want the
// toolbar to show at. row number starts at 0
var toolbar3 = plugins.window.addToolBar("toolbar_3", "toolbar_3_internal_name", 3);
toolbar3.addButton("click me 3", feedback_button);
```

**addToolBar**

[ToolBar](#) **addToolBar** (name, row)

Add a toolbar.

#### Parameters

{String} name - the name by which this toolbar is identified in code. If display name is missing, name will be used as displayName as well.  
 {Number} row - the row inside the toolbar panel where this toolbar is to be added.

#### Returns

ToolBar

#### Sample

```
// Note: method addToolBar only works in the smart client.

// add a toolbar with only a name
var toolbar0 = plugins.window.addToolBar("toolbar_0");
toolbar0.addButton("click me 0", feedback_button);

// add a toolbar with a name and the row you want it to show at
// row number starts at 0
var toolbar1 = plugins.window.addToolBar("toolbar_1", 2);
toolbar1.addButton("click me 1", feedback_button);

// add a toolbar with a name and display name
var toolbar2 = plugins.window.addToolBar("toolbar_2", "toolbar_2_internal_name");
toolbar2.addButton("click me 2", feedback_button);

// add a toolbar with a name, display name and the row you want the
// toolbar to show at. row number starts at 0
var toolbar3 = plugins.window.addToolBar("toolbar_3", "toolbar_3_internal_name", 3);
toolbar3.addButton("click me 3", feedback_button);
```

### addToolBar

ToolBar **addToolBar** (name, displayname)

Add a toolbar.

#### Parameters

{String} name - the name by which this toolbar is identified in code. If display name is missing, name will be used as displayName as well.  
 {String} displayname - the name by which this toolbar will be identified in the UI. (for example in the toolbar panel's context menu)

#### Returns

ToolBar

#### Sample

```
// Note: method addToolBar only works in the smart client.

// add a toolbar with only a name
var toolbar0 = plugins.window.addToolBar("toolbar_0");
toolbar0.addButton("click me 0", feedback_button);

// add a toolbar with a name and the row you want it to show at
// row number starts at 0
var toolbar1 = plugins.window.addToolBar("toolbar_1", 2);
toolbar1.addButton("click me 1", feedback_button);

// add a toolbar with a name and display name
var toolbar2 = plugins.window.addToolBar("toolbar_2", "toolbar_2_internal_name");
toolbar2.addButton("click me 2", feedback_button);

// add a toolbar with a name, display name and the row you want the
// toolbar to show at. row number starts at 0
var toolbar3 = plugins.window.addToolBar("toolbar_3", "toolbar_3_internal_name", 3);
toolbar3.addButton("click me 3", feedback_button);
```

### addToolBar

ToolBar **addToolBar** (name, displayname, row)

Add a toolbar.

**Parameters**

{String} name - the name by which this toolbar is identified in code. If display name is missing, name will be used as displayName as well.  
 {String} displayName - the name by which this toolbar will be identified in the UI. (for example in the toolbar panel's context menu)  
 {Number} row - the row inside the toolbar panel where this toolbar is to be added.

**Returns**

ToolBar

**Sample**

```
// Note: method addToolBar only works in the smart client.

// add a toolbar with only a name
var toolbar0 = plugins.window.addToolBar("toolbar_0");
toolbar0.addButton("click me 0", feedback_button);

// add a toolbar with a name and the row you want it to show at
// row number starts at 0
var toolbar1 = plugins.window.addToolBar("toolbar_1", 2);
toolbar1.addButton("click me 1", feedback_button);

// add a toolbar with a name and display name
var toolbar2 = plugins.window.addToolBar("toolbar_2", "toolbar_2_internal_name");
toolbar2.addButton("click me 2", feedback_button);

// add a toolbar with a name, display name and the row you want the
// toolbar to show at. row number starts at 0
var toolbar3 = plugins.window.addToolBar("toolbar_3", "toolbar_3_internal_name", 3);
toolbar3.addButton("click me 3", feedback_button);
```

**cancelFormPopup**

void **cancelFormPopup**()

Close the current form popup panel without assigning a value to the configured data provider.

**Returns**

void

**Sample**

```
// Show a form as popup panel, where the closeFormPopup can pass return a value to a dataprovider in the
// specified scope.
plugins.window.showFormPopup(null, forms.orderPicker, foundset.getSelectedRecord(), "order_id");
// do call closeFormPopup(ordervalue) from the orderPicker form
```

**closeFormPopup**

void **closeFormPopup**(retval)

Close the current form popup panel and assign the value to the configured data provider.

**Parameters**

{Object} retval - return value for data provider

**Returns**

void

**Sample**

```
// Show a form as popup panel, where the closeFormPopup can pass return a value to a dataprovider in the
// specified scope.
plugins.window.showFormPopup(null, forms.orderPicker, foundset.getSelectedRecord(), "order_id");
// do call closeFormPopup(ordervalue) from the orderPicker form
```

**createPopupMenu**

Popup **createPopupMenu**()

Creates a new popup menu that can be populated with items and displayed.

**Returns**

Popup

**Sample**

```
// create a popup menu
var menu = plugins.window.createPopupMenu();
// add a menu item
menu.addMenuItem("an entry", feedback);

if (event.getSource()) {
    // display the popup over the component which is the source of the event
    menu.show(event.getSource());
    // display the popup over the components, at specified coordinates relative to the component
    //menu.show(event.getSource(), 10, 10);
    // display the popup at specified coordinates relative to the main window
    //menu.show(100, 100);
}
```

**createShortcut****Boolean createShortcut (shortcut, methodName)**

Create a shortcut.

**Parameters**

{[String](#)} **shortcut**  
 {[String](#)} **methodName** - scopes.scopename.methodname or formname.methodname String to target the method to execute

**Returns****Boolean****Sample**

```
// this plugin uses the java keystroke parser
// see http://java.sun.com/j2se/1.5.0/docs/api/javax/swing/KeyStroke.html#getKeyStroke(java.lang.String)
// global handler
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut);
// global handler with a form context filter
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut, 'frm_contacts');
// form method called when shortcut is used
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut);
// form method called when shortcut is used and arguments are passed to the method
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut, new Array(argument1,
argument2));
// Passing the method argument as a string prevents unnecessary form loading
//plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', new Array(argument1,
argument2));
// Passing the method as a name and the contextFilter set so that this shortcut only trigger on the form
// 'frm_contacts'.
plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', 'frm_contacts', new Array
(argument1, argument2));
// remove global shortcut and form-level shortcut
plugins.window.removeShortcut('menu 1');
plugins.window.removeShortcut('control RIGHT', 'frm_contacts');
// shortcut handlers are called with an JSEvent argument
/***
// * Handle keyboard shortcut.
// *
// * @param {JSEvent} event the event that triggered the action
// */
//function handleShortcut(event)
//{
//  application.output(event.getType()) // returns 'menu 1'
//  application.output(event.getFormName()) // returns 'frm_contacts'
//  application.output(event.getElementName()) // returns 'contact_name_field' or null when no element is
selected
//}
// NOTE: shortcuts will not override existing operating system or browser shortcuts,
// choose your shortcuts careful to make sure they work in all clients.
```

**createShortcut****Boolean createShortcut (shortcut, methodName, arguments)**

Create a shortcut.

**Parameters**

{String} shortcut  
 {String} methodName - scopes.scopename.methodname or formname.methodname String to target the method to execute  
 {Object[]} arguments

**Returns**

Boolean

**Sample**

```
// this plugin uses the java keystroke parser
// see http://java.sun.com/j2se/1.5.0/docs/api/javafx/swing/KeyStroke.html#getKeyStroke(java.lang.String)
// global handler
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut);
// global handler with a form context filter
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut, 'frm_contacts');
// form method called when shortcut is used
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut);
// form method called when shortcut is used and arguments are passed to the method
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut, new Array(argument1,
argument2));
// Passing the method argument as a string prevents unnecessary form loading
//plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', new Array(argument1,
argument2));
// Passing the method as a name and the contextFilter set so that this shortcut only trigger on the form
'frm_contacts'.
plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', 'frm_contacts', new Array
(argument1, argument2));
// remove global shortcut and form-level shortcut
plugins.window.removeShortcut('menu 1');
plugins.window.removeShortcut('control RIGHT', 'frm_contacts');
// shortcut handlers are called with an JSEvent argument
/**/
// * Handle keyboard shortcut.
// *
// * @param {JSEvent} event the event that triggered the action
// */
//function handleShortcut(event)
//{
// application.output(event.getType()) // returns 'menu 1'
// application.output(event.getFormName()) // returns 'frm_contacts'
// application.output(event.getElementName()) // returns 'contact_name_field' or null when no element is
selected
//}
// NOTE: shortcuts will not override existing operating system or browser shortcuts,
// choose your shortcuts careful to make sure they work in all clients.
```

**createShortcut**

**Boolean createShortcut (shortcut, methodName, contextFilter)**

Create a shortcut.

**Parameters**

{String} shortcut  
 {String} methodName - scopes.scopename.methodname or formname.methodname String to target the method to execute  
 {String} contextFilter - only triggers the shortcut when on this form

**Returns**

Boolean

**Sample**

```

// this plugin uses the java keystroke parser
// see http://java.sun.com/j2se/1.5.0/docs/api/javax/swing/KeyStroke.html#getKeyStroke(java.lang.String)
// global handler
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut);
// global handler with a form context filter
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut, 'frm_contacts');
// form method called when shortcut is used
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut);
// form method called when shortcut is used and arguments are passed to the method
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut, new Array(argument1,
argument2));
// Passing the method argument as a string prevents unnecessary form loading
//plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', new Array(argument1,
argument2));
// Passing the method as a name and the contextFilter set so that this shortcut only trigger on the form
'frm_contacts'.
plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', 'frm_contacts', new Array
(argument1, argument2));
// remove global shortcut and form-level shortcut
plugins.window.removeShortcut('menu 1');
plugins.window.removeShortcut('control RIGHT', 'frm_contacts');
// shortcut handlers are called with an JSEvent argument
/***
// * Handle keyboard shortcut.
// *
// * @param {JSEvent} event the event that triggered the action
// */
//function handleShortcut(event)
//{
//  application.output(event.getType()) // returns 'menu 1'
//  application.output(event.getFormName()) // returns 'frm_contacts'
//  application.output(event.getElementName()) // returns 'contact_name_field' or null when no element is
selected
//}
// NOTE: shortcuts will not override existing operating system or browser shortcuts,
// choose your shortcuts careful to make sure they work in all clients.

```

**createShortcut****Boolean** **createShortcut** (shortcut, methodName, contextFilter, arguments)

Create a shortcut.

**Parameters**

**{String}** shortcut  
**{String}** methodName - scopes.scopename.methodname or formname.methodname String to target the method to execute  
**{String}** contextFilter - only triggers the shortcut when on this form  
**{Object[]}** arguments

**Returns****Boolean**

**Sample**

```

// this plugin uses the java keystroke parser
// see http://java.sun.com/j2se/1.5.0/docs/api/javax/swing/KeyStroke.html#getKeyStroke(java.lang.String)
// global handler
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut);
// global handler with a form context filter
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut, 'frm_contacts');
// form method called when shortcut is used
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut);
// form method called when shortcut is used and arguments are passed to the method
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut, new Array(argument1,
argument2));
// Passing the method argument as a string prevents unnecessary form loading
//plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', new Array(argument1,
argument2));
// Passing the method as a name and the contextFilter set so that this shortcut only trigger on the form
'frm_contacts'.
plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', 'frm_contacts', new Array
(argument1, argument2));
// remove global shortcut and form-level shortcut
plugins.window.removeShortcut('menu 1');
plugins.window.removeShortcut('control RIGHT', 'frm_contacts');
// shortcut handlers are called with an JSEvent argument
/***
// * Handle keyboard shortcut.
// *
// * @param {JSEvent} event the event that triggered the action
// */
//function handleShortcut(event)
//{
//  application.output(event.getType()) // returns 'menu 1'
//  application.output(event.getFormName()) // returns 'frm_contacts'
//  application.output(event.getElementName()) // returns 'contact_name_field' or null when no element is
selected
//}
// NOTE: shortcuts will not override existing operating system or browser shortcuts,
// choose your shortcuts careful to make sure they work in all clients.

```

**createShortcut****Boolean** **createShortcut** (shortcut, method)

Create a shortcut.

**Parameters**{**String**} shortcut{**Function**} method - the method/function that needs to be called when the shortcut is hit**Returns****Boolean**

**Sample**

```

// this plugin uses the java keystroke parser
// see http://java.sun.com/j2se/1.5.0/docs/api/javax/swing/KeyStroke.html#getKeyStroke(java.lang.String)
// global handler
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut);
// global handler with a form context filter
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut, 'frm_contacts');
// form method called when shortcut is used
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut);
// form method called when shortcut is used and arguments are passed to the method
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut, new Array(argument1,
argument2));
// Passing the method argument as a string prevents unnecessary form loading
//plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', new Array(argument1,
argument2));
// Passing the method as a name and the contextFilter set so that this shortcut only trigger on the form
'frm_contacts'.
plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', 'frm_contacts', new Array
(argument1, argument2));
// remove global shortcut and form-level shortcut
plugins.window.removeShortcut('menu 1');
plugins.window.removeShortcut('control RIGHT', 'frm_contacts');
// shortcut handlers are called with an JSEvent argument
/***
// * Handle keyboard shortcut.
// *
// * @param {JSEvent} event the event that triggered the action
// */
//function handleShortcut(event)
//{
//  application.output(event.getType()) // returns 'menu 1'
//  application.output(event.getFormName()) // returns 'frm_contacts'
//  application.output(event.getElementName()) // returns 'contact_name_field' or null when no element is
selected
//}
// NOTE: shortcuts will not override existing operating system or browser shortcuts,
// choose your shortcuts careful to make sure they work in all clients.

```

**createShortcut****Boolean** **createShortcut** (shortcut, method, arguments)

Create a shortcut.

**Parameters**

**{String}** shortcut  
**{Function}** method - the method/function that needs to be called when the shortcut is hit  
**{Object[]}** arguments

**Returns****Boolean**

**Sample**

```

// this plugin uses the java keystroke parser
// see http://java.sun.com/j2se/1.5.0/docs/api/javax/swing/KeyStroke.html#getKeyStroke(java.lang.String)
// global handler
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut);
// global handler with a form context filter
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut, 'frm_contacts');
// form method called when shortcut is used
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut);
// form method called when shortcut is used and arguments are passed to the method
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut, new Array(argument1,
argument2));
// Passing the method argument as a string prevents unnecessary form loading
//plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', new Array(argument1,
argument2));
// Passing the method as a name and the contextFilter set so that this shortcut only trigger on the form
'frm_contacts'.
plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', 'frm_contacts', new Array
(argument1, argument2));
// remove global shortcut and form-level shortcut
plugins.window.removeShortcut('menu 1');
plugins.window.removeShortcut('control RIGHT', 'frm_contacts');
// shortcut handlers are called with an JSEvent argument
/***
// * Handle keyboard shortcut.
// *
// * @param {JSEvent} event the event that triggered the action
// */
//function handleShortcut(event)
//{
//  application.output(event.getType()) // returns 'menu 1'
//  application.output(event.getFormName()) // returns 'frm_contacts'
//  application.output(event.getElementName()) // returns 'contact_name_field' or null when no element is
selected
//}
// NOTE: shortcuts will not override existing operating system or browser shortcuts,
// choose your shortcuts careful to make sure they work in all clients.

```

**createShortcut****Boolean** **createShortcut** (shortcut, method, contextFilter)

Create a shortcut.

**Parameters**{**String**} shortcut{**Function**} method - the method/function that needs to be called when the shortcut is hit{**String**} contextFilter - only triggers the shortcut when on this form**Returns****Boolean**

**Sample**

```

// this plugin uses the java keystroke parser
// see http://java.sun.com/j2se/1.5.0/docs/api/javax/swing/KeyStroke.html#getKeyStroke(java.lang.String)
// global handler
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut);
// global handler with a form context filter
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut, 'frm_contacts');
// form method called when shortcut is used
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut);
// form method called when shortcut is used and arguments are passed to the method
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut, new Array(argument1,
argument2));
// Passing the method argument as a string prevents unnecessary form loading
//plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', new Array(argument1,
argument2));
// Passing the method as a name and the contextFilter set so that this shortcut only trigger on the form
'frm_contacts'.
plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', 'frm_contacts', new Array
(argument1, argument2));
// remove global shortcut and form-level shortcut
plugins.window.removeShortcut('menu 1');
plugins.window.removeShortcut('control RIGHT', 'frm_contacts');
// shortcut handlers are called with an JSEvent argument
/***
// * Handle keyboard shortcut.
// *
// * @param {JSEvent} event the event that triggered the action
// */
//function handleShortcut(event)
//{
//  application.output(event.getType()) // returns 'menu 1'
//  application.output(event.getFormName()) // returns 'frm_contacts'
//  application.output(event.getElementName()) // returns 'contact_name_field' or null when no element is
selected
//}
// NOTE: shortcuts will not override existing operating system or browser shortcuts,
// choose your shortcuts careful to make sure they work in all clients.

```

**createShortcut****Boolean** **createShortcut** (shortcut, method, contextFilter, arguments)

Create a shortcut.

**Parameters**

{[String](#)} **shortcut**  
{[Function](#)} **method** - the method/function that needs to be called when the shortcut is hit  
{[String](#)} **contextFilter** - only triggers the shortcut when on this form  
{[Object](#)[])} **arguments**

**Returns**[Boolean](#)

**Sample**

```
// this plugin uses the java keystroke parser
// see http://java.sun.com/j2se/1.5.0/docs/api/javax/swing/KeyStroke.html#getKeyStroke(java.lang.String)
// global handler
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut);
// global handler with a form context filter
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut, 'frm_contacts');
// form method called when shortcut is used
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut);
// form method called when shortcut is used and arguments are passed to the method
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut, new Array(argument1, argument2));
// Passing the method argument as a string prevents unnecessary form loading
//plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', new Array(argument1, argument2));
// Passing the method as a name and the contextFilter set so that this shortcut only trigger on the form
// 'frm_contacts'.
plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', 'frm_contacts', new Array(argument1, argument2));
// remove global shortcut and form-level shortcut
plugins.window.removeShortcut('menu 1');
plugins.window.removeShortcut('control RIGHT', 'frm_contacts');
// shortcut handlers are called with an JSEvent argument
/***
// * Handle keyboard shortcut.
// *
// * @param {JSEvent} event the event that triggered the action
// */
//function handleShortcut(event)
//{
//  application.output(event.getType()) // returns 'menu 1'
//  application.output(event.getFormName()) // returns 'frm_contacts'
//  application.output(event.getElementName()) // returns 'contact_name_field' or null when no element is selected
//}
// NOTE: shortcuts will not override existing operating system or browser shortcuts,
// choose your shortcuts careful to make sure they work in all clients.
```

**getMenuBar****MenuBar getMenuBar ()**

Get the menubar of the main window, or of a named window.

**Returns****MenuBar****Sample**

```
// create a new window
var win = application.createWindow("windowName", JSWindow.WINDOW);
// show a form in the new window
forms.my_form.controller.show(win);
// retrieve the menubar of the new window
var menubar = plugins.window.getMenuBar("windowName");
// add a new menu to the menubar, with an item in it
var menu = menubar.addMenu();
menu.text = "New Menu";
menu.addItem("an entry", feedback);
// retrieve the menubar of the main window
var mainMenubar = plugins.window.getMenuBar();
// add a new menu to the menubar of the main window
var menuMain = mainMenubar.addMenu();
menuMain.text = "New Menu in Main Menubar";
menuMain.addItem("another entry", feedback);
```

**getMenuBar****MenuBar getMenuBar (windowName)**

Get the menubar of the main window, or of a named window.

**Parameters**

{String} windowName - the name of the window

**Returns**

MenuBar

**Sample**

```
// create a new window
var win = application.createWindow("windowName", JSWindow.WINDOW);
// show a form in the new window
forms.my_form.controller.show(win);
// retrieve the menubar of the new window
var menubar = plugins.window.getMenuBar("windowName");
// add a new menu to the menubar, with an item in it
var menu = menubar.addMenu();
menu.text = "New Menu";
menu.addMenuItem("an entry", feedback);
// retrieve the menubar of the main window
var mainMenubar = plugins.window.getMenuBar();
// add a new menu to the menubar of the main window
var menuMain = mainMenubar.addMenu();
menuMain.text = "New Menu in Main Menubar";
menuMain.addMenuItem("another entry", feedback);
```

**getToolBar****ToolBar** **getToolBar** (window, name)

Get the toolbar of a specific window from the toolbar panel by name.

**Parameters**{JSWindow} window  
{String} name**Returns**

ToolBar

**Sample**

```
// Note: method getToolBar only works in the smart client.

// create a window
    var win = application.createWindow("myWindow", JSWindow.WINDOW);
// the toolbar must first be created with a call to addToolbar
plugins.window.addToolBar(win,"toolbar_0");

// show the empty toolbar and wait 4 seconds
win.show(forms.MyForm)
application.updateUI(4000)

// get the toolbar at the panel by name
var toolbar = plugins.window.getToolBar(win,"toolbar_0");
// add a button to the toolbar
toolbar.addButton("button", callback_function);
```

**getToolBar****ToolBar** **getToolBar** (name)

Get the toolbar from the toolbar panel by name.

**Parameters**

{String} name

**Returns**

ToolBar

**Sample**

```
// Note: method getToolBar only works in the smart client.

// the toolbar must first be created with a call to addToolbar
plugins.window.addToolBar("toolbar_0");

// get the toolbar at the panel by name
var toolbar = plugins.window.getToolBar("toolbar_0");
// add a button to the toolbar
toolbar.addButton("button", feedback_button);
```

**getToolbarNames****String[] getToolbarNames ()**

Get all toolbar names from the toolbar panel.

**Returns****String[]****Sample**

```
// Note: method getToolbarNames only works in the smart client.

// create an array of toolbar names
var names = plugins.window.getToolbarNames();

// create an empty message variable
var message = "";

// loop through the array
for (var i = 0 ; i < names.length ; i++) {
    //add the name(s) to the message
    message += names[i] + "\n";
}

// show the message
plugins.dialogs.showInfoDialog("toolbar names", message);
```

**getToolbarNames****String[] getToolbarNames (window)**

Get all toolbar names from the toolbar panel of a specific window.

**Parameters**

{JSWindow} window

**Returns****String[]**

**Sample**

```
// Note: method getToolbarNames only works in the smart client.
// create a window
    var win = application.createWindow("myWindow", JSWindow.WINDOW);
// the toolbar must first be created with a call to addToolBar
    plugins.window.addToolBar(win,"toolbar_0");
    plugins.window.addToolBar(win,"toolbar_1");
// create an array of toolbar names
var names = plugins.window.getToolbarNames(win);

// create an empty message variable
var message = "";

// loop through the array
for (var i = 0 ; i < names.length ; i++) {
    //add the name(s) to the message
    message += names[i] + "\n";
}

// show the message
plugins.dialogs.showInfoDialog("toolbar names", message);
```

**maximize****void maximize ()**

Maximize the current window or the window with the specified name (Smart client only).

**Returns****void****Sample**

```
// maximize the main window:
plugins.window.maximize();

// create a new window
var win = application.createWindow("windowName", JSWindow.WINDOW);
// show a form in the new window
forms.my_form.controller.show(win);
// maximize the window
plugins.window.maximize("windowName");
```

**maximize****void maximize (windowName)**

Maximize the current window or the window with the specified name (Smart client only).

**Parameters****{String} windowName****Returns****void****Sample**

```
// maximize the main window:
plugins.window.maximize();

// create a new window
var win = application.createWindow("windowName", JSWindow.WINDOW);
// show a form in the new window
forms.my_form.controller.show(win);
// maximize the window
plugins.window.maximize("windowName");
```

**removeShortcut****Boolean removeShortcut (shortcut)**

Remove a shortcut.

**Parameters**

{String} shortcut

**Returns**

Boolean

**Sample**

```

// this plugin uses the java keystroke parser
// see http://java.sun.com/j2se/1.5.0/docs/api/javax/swing/KeyStroke.html#getKeyStroke(java.lang.String)
// global handler
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut);
// global handler with a form context filter
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut, 'frm_contacts');
// form method called when shortcut is used
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut);
// form method called when shortcut is used and arguments are passed to the method
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut, new Array(argument1,
argument2));
// Passing the method argument as a string prevents unnecessary form loading
//plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', new Array(argument1,
argument2));
// Passing the method as a name and the contextFilter set so that this shortcut only trigger on the form
// 'frm_contacts'.
plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', 'frm_contacts', new Array
(argument1, argument2));
// remove global shortcut and form-level shortcut
plugins.window.removeShortcut('menu 1');
plugins.window.removeShortcut('control RIGHT', 'frm_contacts');
// shortcut handlers are called with an JSEvent argument
/***
// * Handle keyboard shortcut.
// *
// * @param {JSEvent} event the event that triggered the action
// */
//function handleShortcut(event)
//{
// application.output(event.getType()) // returns 'menu 1'
// application.output(event.getFormName()) // returns 'frm_contacts'
// application.output(event.getElementName()) // returns 'contact_name_field' or null when no element is
selected
//}
// NOTE: shortcuts will not override existing operating system or browser shortcuts,
// choose your shortcuts careful to make sure they work in all clients.

```

**removeShortcut****Boolean** **removeShortcut** (shortcut, contextFilter)

Remove a shortcut.

**Parameters**

{String} shortcut

{String} contextFilter - only triggers the shortcut when on this form

**Returns**

Boolean

**Sample**

```

// this plugin uses the java keystroke parser
// see http://java.sun.com/j2se/1.5.0/docs/api/javax/swing/KeyStroke.html#getKeyStroke(java.lang.String)
// global handler
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut);
// global handler with a form context filter
plugins.window.createShortcut('control shift I', scopes.globals.handleOrdersShortcut, 'frm_contacts');
// form method called when shortcut is used
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut);
// form method called when shortcut is used and arguments are passed to the method
plugins.window.createShortcut('control RIGHT', forms.frm_contacts.handleMyShortcut, new Array(argument1,
argument2));
// Passing the method argument as a string prevents unnecessary form loading
//plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', new Array(argument1,
argument2));
// Passing the method as a name and the contextFilter set so that this shortcut only trigger on the form
'frm_contacts'.
plugins.window.createShortcut('control RIGHT', 'frm_contacts.handleMyShortcut', 'frm_contacts', new Array
(argument1, argument2));
// remove global shortcut and form-level shortcut
plugins.window.removeShortcut('menu 1');
plugins.window.removeShortcut('control RIGHT', 'frm_contacts');
// shortcut handlers are called with an JSEvent argument
/***
// * Handle keyboard shortcut.
// *
// * @param {JSEvent} event the event that triggered the action
// */
//function handleShortcut(event)
//{
//  application.output(event.getType()) // returns 'menu 1'
//  application.output(event.getFormName()) // returns 'frm_contacts'
//  application.output(event.getElementName()) // returns 'contact_name_field' or null when no element is
selected
//}
// NOTE: shortcuts will not override existing operating system or browser shortcuts,
// choose your shortcuts careful to make sure they work in all clients.

```

**removeToolBar**

**void** **removeToolBar** (**window**, **name**)

Remove the toolbar from the toolbar panel of a specific window.

**Parameters**

**{JSWindow}** **window**  
**{String}** **name**

**Returns**

**void**

**Sample**

```

// Note: method removeToolBar only works in the smart client.
// create a window
    var win = application.createWindow("myWindow", JSwindow.WINDOW);
// the toolbar must first be created with a call to addToolbar
var toolbar = plugins.window.addToolBar(win,"toolbar_0");

// add a button to the toolbar
toolbar.addButton("button", callbackMethod);

// show the toolbar with the button and wait 4 seconds, then remove it
win.show(forms.MyForm)
application.updateUI(4000)

// removing a toolbar from the toolbar panel is done by name
// the plugin checks the existence of the toolbar
// when the toolbar does not exist it will not throw an error though.
plugins.window.removeToolBar(win,"toolbar_0");

```

**removeToolBar**

void **removeToolBar** (name)  
 Remove the toolbar from the toolbar panel.

**Parameters**

{String} name

**Returns**

void

**Sample**

```
// Note: method removeToolBar only works in the smart client.

// the toolbar must first be created with a call to addToolbar
var toolbar = plugins.window.addToolBar("toolbar_0");

// add a button to the toolbar
toolbar.addButton("button", feedback_button);

// removing a toolbar from the toolbar panel is done by name
// the plugin checks the existence of the toolbar
// when the toolbar does not exist it will not throw an error though.
plugins.window.removeToolBar("toolbar_0");
```

**setFullScreen**

void **setFullScreen** (full)  
 Bring the window into/out of fullscreen mode.

**Parameters**

{Boolean} full

**Returns**

void

**Sample**

```
// active fullscreen mode
plugins.window.setFullScreen(true);
```

**setStatusBarVisible**

void **setStatusBarVisible** (visible)  
 Show or hide the statusbar.

**Parameters**

{Boolean} visible

**Returns**

void

**Sample**

```
// hide the statusbar
plugins.window.setStatusBarVisible(false);
```

**setToolBarAreaVisible**

void **setToolBarAreaVisible** (visible)  
 Show or hide the toolbar area.

**Parameters**

{Boolean} visible

**Returns**

void

**Sample**

```
// hide the toolbar area
plugins.window.setToolBarAreaVisible(false);
```

**showFormPopup****void showFormPopup (elementToShowRelatedTo, form, scope, dataproviderID)**

Show a form as popup panel, where the closeFormPopup can pass return a value to a dataprovider in the specified scope.

**Parameters**

{[RuntimeComponent](#)} elementToShowRelatedTo - element to show related to or null to center in screen  
 {[RuntimeForm](#)} form - the form to show  
 {[Object](#)} scope - the scope to put retval into  
 {[String](#)} dataproviderID - the dataprovider of scope to fill

**Returns**

void

**Sample**

```
// Show a form as popup panel, where the closeFormPopup can pass return a value to a dataprovider in the
// specified scope.
plugins.window.showFormPopup(null,forms.orderPicker,foundset.getSelectedRecord(),"order_id");
// do call closeFormPopup(ordervalue) from the orderPicker form
```

**showFormPopup****void showFormPopup (elementToShowRelatedTo, form, scope, dataproviderID, width, height)**

Show a form as popup panel, where the closeFormPopup can pass return a value to a dataprovider in the specified scope.

**Parameters**

{[RuntimeComponent](#)} elementToShowRelatedTo - element to show related to or null to center in screen  
 {[RuntimeForm](#)} form - the form to show  
 {[Object](#)} scope - the scope to put retval into  
 {[String](#)} dataproviderID - the dataprovider of scope to fill  
 {[Number](#)} width - popup width  
 {[Number](#)} height - popup height

**Returns**

void

**Sample**

```
// Show a form as popup panel, where the closeFormPopup can pass return a value to a dataprovider in the
// specified scope.
plugins.window.showFormPopup(null,forms.orderPicker,foundset.getSelectedRecord(),"order_id");
// do call closeFormPopup(ordervalue) from the orderPicker form
```
