

# Number

## Property Summary

Number	<a href="#">MAX_VALUE</a> The largest representable number.
Number	<a href="#">MIN_VALUE</a> The smallest representable number.
Number	<a href="#">NEGATIVE_INFINITY</a> Special value representing negative infinity; returned on overflow.
Object	<a href="#">NaN</a> Special "not a number" value.
Number	<a href="#">POSITIVE_INFINITY</a> Special value representing infinity; returned on overflow.

## Method Summary

String	<a href="#">toExponential()</a> Returns a string representing the number in exponential notation.
String	<a href="#">toExponential(fractionDigits)</a> Returns a string representing the number in exponential notation.
String	<a href="#">toFixed()</a> Returns a string representing the number in fixed-point notation.
String	<a href="#">toFixed(digits)</a> Returns a string representing the number in fixed-point notation.
String	<a href="#">toLocaleString()</a> Converts the number into a string which is suitable for presentation in the given locale.
String	<a href="#">toPrecision()</a> Returns a string representing the number to a specified precision in fixed-point or exponential notation.
String	<a href="#">toPrecision(precision)</a> Returns a string representing the number to a specified precision in fixed-point or exponential notation.
String	<a href="#">toString()</a> Returns a string representing the specified Number object.
String	<a href="#">toString(radix)</a> Returns a string representing the specified Number object.

## Property Details

### MAX\_VALUE

The largest representable number.

#### Returns

[Number](#)

#### Sample

```
application.output("Largest number: " + Number.MAX_VALUE);
```

### MIN\_VALUE

The smallest representable number.

#### Returns

[Number](#)

#### Sample

```
application.output("Smallest number: " + Number.MIN_VALUE);
```

### NEGATIVE\_INFINITY

Special value representing negative infinity; returned on overflow.

---

**Returns**[Number](#)**Sample**

```
application.output("Negative infinity: " + Number.NEGATIVE_INFINITY);
```

**NaN**

Special "not a number" value.

**Returns**[Object](#)**Sample**

```
application.output("NaN: " + Number.NaN);
```

**POSITIVE\_INFINITY**

Special value representing infinity; returned on overflow.

**Returns**[Number](#)**Sample**

```
application.output("Positive infinity: " + Number.POSITIVE_INFINITY);
```

## Method Details

**toExponential**

[String](#) **toExponential** ()

Returns a string representing the number in exponential notation.

**Returns**

[String](#) - A string representing the number in exponential notation.

**Sample**

```
var n = 123.45678;  
application.output(n.toExponential(3));
```

**toExponential**

[String](#) **toExponential** (fractionDigits)

Returns a string representing the number in exponential notation.

**Parameters**

{[Number](#)} fractionDigits - An integer specifying the number of digits after the decimal point. Defaults to as many digits as necessary to specify the number.

**Returns**

[String](#) - A string representing the number in exponential notation.

**Sample**

```
var n = 123.45678;  
application.output(n.toExponential(3));
```

**toFixed**

[String](#) **toFixed** ()

Returns a string representing the number in fixed-point notation.

---

**Returns**

[String](#) - A string representing the number in fixed-point notation.

**Sample**

```
var n = 123.45678;
application.output(n.toFixed(3));
```

**toFixed**

[String](#) [toFixed](#) (digits)

Returns a string representing the number in fixed-point notation.

**Parameters**

{[Number](#)} digits - The number of digits to appear after the decimal point. Defaults to 0.

**Returns**

[String](#) - A string representing the number in fixed-point notation.

**Sample**

```
var n = 123.45678;
application.output(n.toFixed(3));
```

**toLocaleString**

[String](#) [toLocaleString](#) ()

Converts the number into a string which is suitable for presentation in the given locale.

**Returns**

[String](#) - A string representing the number in the current locale.

**Sample**

```
var n = 1000000;
application.output(n.toLocaleString());
```

**toPrecision**

[String](#) [toPrecision](#) ()

Returns a string representing the number to a specified precision in fixed-point or exponential notation.

**Returns**

[String](#) - A string representing the number to a specified precision in fixed-point or exponential notation.

**Sample**

```
var n = 123.45678;
application.output(n.toPrecision(5));
```

**toPrecision**

[String](#) [toPrecision](#) (precision)

Returns a string representing the number to a specified precision in fixed-point or exponential notation.

**Parameters**

{[Number](#)} precision - An integer specifying the number of significant digits.

**Returns**

[String](#) - A string representing the number to a specified precision in fixed-point or exponential notation.

**Sample**

```
var n = 123.45678;
application.output(n.toPrecision(5));
```

**toString**

[String](#) [toString](#) ()

Returns a string representing the specified Number object.

---

**Returns**

[String](#) - A string representing the specified Number object.

**Sample**

```
var n = 7;
application.output(n.toString()); //displays "7"
application.output(n.toString(2)); //displays "111"
```

**toString**

[String](#) **toString** (radix)

Returns a string representing the specified Number object.

**Parameters**

{[Number](#)} radix - An integer between 2 and 36 specifying the base to use for representing numeric values

**Returns**

[String](#) - A string representing the specified Number object.

**Sample**

```
var n = 7;
application.output(n.toString()); //displays "7"
application.output(n.toString(2)); //displays "111"
```
