

String

Property Summary

Number	<code>length</code>
	Gives the length of the string.

Method Summary

String	<code>anchor(nameAttribute)</code>
	returns a copy of the string embedded within an anchor <A> tag set.
String	<code>big()</code>
	returns a copy of the string embedded within an <BIG> tag set.
String	<code>blink()</code>
	returns a copy of the string embedded within an <BLINK> tag set.
String	<code>bold()</code>
	returns a copy of the string embedded within an tag set.
Number	<code>charAt(index)</code>
	returns a character of the string.
Number	<code>charCodeAt(index)</code>
	returns a decimal code of the char in the string.
String	<code>concat(string2)</code>
	returns a string that appends the parameter string to the string.
String	<code>concat(string2, stringN)</code>
	returns a string that appends the parameter string to the string.
Boolean	<code>equals(other)</code>
	returns a boolean that checks if the given string is equal to the string
Boolean	<code>equalsIgnoreCase(other)</code>
	returns a boolean that checks if the given string is equal to the string ignoring case
String	<code>fixed()</code>
	returns a copy of the string embedded within an anchor <TT> tag set.
String	<code>fontcolor(color)</code>
	returns a copy of the string embedded within an tag set, the color param is assigned the the color attribute.
String	<code>fontsize(size)</code>
	returns a copy of the string embedded within an tag set, The size param is set to the SIZE attribute
String	<code>fromCharCode(num)</code>
	returns a string created by using the specified sequence of Unicode values.
Number	<code>indexOf(searchValue, fromIndex)</code>
	returns the found index of the given string in string.
String	<code>italics()</code>
	returns a copy of the string embedded within an <I> tag set
Number	<code>lastIndexOf(searchValue, fromIndex)</code>
	returns the found index of the given string in string from the end.
String	<code>link(hrefAttribute)</code>
	returns a copy of the string embedded within an <A> tag set.
Number	<code>localeCompare(otherString)</code>
Array	<code>match(regexp)</code>
	returns an array of strings within the current string that matches the regexp.
String	<code>replace(regexp, function)</code>
	returns a new string where the matches of the given regexp are replaced by the return value of the function.
String	<code>replace(regexp, newSubStr)</code>
	returns a new string where the matches of the given regexp are replaced by newSubStr.
String	<code>replace(substr, function)</code>
	returns a new string where the first match of the given substr is replaced by the return value of the function.
String	<code>replace(substr, newSubStr)</code>
	returns a new string where the first match of the given substr is replaced by newSubStr.
Number	<code>search(regexp)</code>
	returns an index where the first match is found of the regexp
String	<code>slice(beginSlice)</code>
	returns a substring of the string.
String	<code>slice(beginSlice, endSlice)</code>
	returns a substring of the string.
String	<code>small()</code>
	returns a copy of the string embedded within an <SMALL> tag set.
String	<code>split(separator, limit)</code>
	returns an array of objects whose elements are segments of the current string.
String	<code>strike()</code>
	returns a copy of the string embedded within an <STRIKE> tag set.

<code>String</code>	<code>sub()</code> returns a copy of the string embedded within an <SUB> tag set.
<code>String</code>	<code>substr(start)</code> returns a substring of the string from the start with the number of chars specified.
<code>String</code>	<code>substr(start, length)</code> returns a substring of the string from the start with the number of chars specified.
<code>String</code>	<code>substring(indexA)</code> Returns a substring of the string from the start index until the end index.
<code>String</code>	<code>substring(indexA, indexB)</code> Returns a substring of the string from the start index until the end index.
<code>String</code>	<code>sup()</code> returns a copy of the string embedded within an <SUP> tag set.
<code>String</code>	<code>toLocaleLowerCase()</code>
<code>String</code>	<code>toLocaleUpperCase()</code>
<code>String</code>	<code>toLowerCase()</code> returns a string with all lowercase letters of the current string.
<code>String</code>	<code>toUpperCase()</code> returns a string with all uppercase letters of the current string.

Property Details

length

Gives the length of the string.

Returns

`Number`

Sample

```
string.length;
```

Method Details

anchor

`String anchor (nameAttribute)`

returns a copy of the string embedded within an anchor <A> tag set.

Parameters

`{String} nameAttribute`

Returns

`String`

Sample

```
string.anchor();
```

big

`String big ()`

returns a copy of the string embedded within an <BIG> tag set.

Returns

`String`

Sample

```
string.big();
```

blink

`String blink ()`

returns a copy of the string embedded within an <BLINK> tag set.

Returns`String`**Sample**

```
string.blink();
```

bold`String bold()`

returns a copy of the string embedded within an tag set.

Returns`String`**Sample**

```
string.bold();
```

charAt`Number charAt(index)`

returns a character of the string.

Parameters`{Number} index`**Returns**`Number`**Sample**

```
string.charAt(integer_position);
```

charCodeAt`Number charCodeAt(index)`

returns a decimal code of the char in the string.

Parameters`{Number} index`**Returns**`Number`**Sample**

```
string.charCodeAt(integer_position);
```

concat`String concat(string2)`

returns a string that appends the parameter string to the string.

Parameters`{String} string2`**Returns**`String`**Sample**

```
string.concat(string);
```

concat`String concat(string2, stringN)`

returns a string that appends the parameter string to the string.

Parameters

{String} string2
 {String} stringN

Returns

String

Sample

```
string.concat(string);
```

equals

Boolean equals (other)

returns a boolean that checks if the given string is equal to the string

Parameters

{String} other

Returns

Boolean

Sample

```
string.equals(string);
```

equalsIgnoreCase

Boolean equalsIgnoreCase (other)

returns a boolean that checks if the given string is equal to the string ignoring case

Parameters

{String} other

Returns

Boolean

Sample

```
string.equalsIgnoreCase(string);
```

fixed

String fixed ()

returns a copy of the string embedded within an anchor <TT> tag set.

Returns

String

Sample

```
string.fixed();
```

fontcolor

String fontcolor (color)

returns a copy of the string embedded within an tag set, the color param is assigned the the color attribute.

Parameters

{String} color

Returns

String

Sample

```
string.fontcolor(color);
```

fontsize

String fontsize (size)

returns a copy of the string embedded within an tag set, The size param is set to the SIZE attribute

Parameters

{Number} size

Returns

String

Sample

```
string.fontsize(size);
```

fromCharCode

String fromCharCode (num)

returns a string created by using the specified sequence of Unicode values.

Parameters

{Number...} num

Returns

String

Sample

```
String.fromCharCode(num)
// String.fromCharCode(num1,num2,num3)
```

indexOf

Number indexOf (searchValue, fromIndex)

returns the found index of the given string in string.

Parameters

{String} searchValue
{Number} fromIndex

Returns

Number

Sample

```
string.indexOf(string,startPosition);
```

italics

String italics ()

returns a copy of the string embedded within an <l> tag set

Returns

String

Sample

```
string.italics();
```

lastIndexOf

Number lastIndexOf (searchValue, fromIndex)

returns the found index of the given string in string from the end.

Parameters

{String} searchValue
{Number} fromIndex

Returns

Number

Sample

```
string.lastIndexOf(string,startPosition);
```

link**String** **link** (*hrefAttribute*)

returns a copy of the string embedded within an <A> tag set.

Parameters **{String}** *hrefAttribute***Returns** **String****Sample**

```
string.link(url);
```

localeCompare**Number** **localeCompare** (*otherString*)**Parameters** **{String}** *otherString***Returns** **Number****Sample**

```
var s = "Have a nice day!";
application.output(s.localeCompare("Hello"));
```

match**Array** **match** (*regexp*)

returns an array of strings within the current string that matches the regexp.

Parameters **{RegExp}** *regexp***Returns** **Array****Sample**

```
string.match(regex);
```

replace**String** **replace** (*regexp*, *function*)

returns a new string where the matches of the given regexp are replaced by the return value of the function.

The function parameter is the function to be invoked to create the new substring (to put in place of the substring received from parameter #1).

Parameters **{RegExp}** *regexp*
 {Function} *function***Returns** **String****Sample**

```
//the callback definition
function replacer(match, p1, p2, p3, offset, string){
    // match is the matched substring
    // p1 is non-digits, p2 digits, and p3 non-alphanumerics
    // offset is the offset of the matched substring within the total string being examined
    // string is the total string being examined
    return [p1, p2, p3].join(' - ');
}
// using replace method with replacer callback
newString = "abc12345#$*%".replace(/([^\d]*)(\d*)([^w]*)/, replacer);
```

replace**String replace (regexp, newSubStr)**

returns a new string where the matches of the given regexp are replaced by newSubStr.

Parameters

- {[RegExp](#)} regexp
- {[String](#)} newSubStr

Returns[String](#)**Sample**

```
string.replace(regexp,newSubStr);
//var re = /(\w+)\s(\w+)/;
//var str = "John Smith";
//var newstr = str.replace(re, "$2, $1");
//application.output(newstr);
```

replace**String replace (substr, function)**

returns a new string where the first match of the given substr is replaced by the return value of the function.

The function parameter is the function to be invoked to create the new substring (to put in place of the substring received from parameter #1).

Parameters

- {[String](#)} substr
- {[Function](#)} function

Returns[String](#)**Sample**

```
// the callback definition
function replacer(match){
    return match.toUpperCase()
}
// using replace method with replacer callback
var newString = "abc".replace("a", replacer);
```

replace**String replace (substr, newSubStr)**

returns a new string where the first match of the given substr is replaced by newSubStr.

Parameters

- {[String](#)} substr
- {[String](#)} newSubStr

Returns[String](#)**Sample**

```
string.replace(substr,newSubStr);
```

search**Number search (regexp)**

returns an index where the first match is found of the regexp

Parameters{[RegExp](#)} regexp**Returns**[Number](#)**Sample**

```
string.search(expr);
```

slice

String slice (beginSlice)
returns a substring of the string.

Parameters

{Number} beginSlice

Returns

String

Sample

```
string.slice(start,end);
```

slice

String slice (beginSlice, endSlice)
returns a substring of the string.

Parameters

{Number} beginSlice
{Number} endSlice

Returns

String

Sample

```
string.slice(start,end);
```

small

String small ()
returns a copy of the string embedded within an <SMALL> tag set.

Returns

String

Sample

```
string.small();
```

split

String split (separator, limit)
returns an array of objects whose elements are segments of the current string.

Parameters

{String} separator
{Number} limit

Returns

String

Sample

```
string.split(delimiter,limitInteger);
```

strike

String strike ()
returns a copy of the string embedded within an <STRIKE> tag set.

Returns

String

Sample

```
string.strike();
```

sub**String sub ()**

returns a copy of the string embedded within an <SUB> tag set.

Returns**String****Sample**

```
string.sub();
```

substr**String substr (start)**

returns a substring of the string from the start with the number of chars specified.

Parameters

{Number} start

Returns**String****Sample**

```
string.substr(start, number_of_chars);
```

substr**String substr (start, length)**

returns a substring of the string from the start with the number of chars specified.

Parameters

{Number} start

{Number} length

Returns**String****Sample**

```
string.substr(start, number_of_chars);
```

substring**String substring (indexA)**

Returns a substring of the string from the start index until the end index.

Parameters

{Number} indexA

Returns**String****Sample**

```
string.substring(start, end);
```

substring**String substring (indexA, indexB)**

Returns a substring of the string from the start index until the end index.

Parameters

{Number} indexA

{Number} indexB

Returns**String**

Sample

```
string.substring(start, end);
```

sup**String sup ()**

returns a copy of the string embedded within an <SUP> tag set.

Returns**String****Sample**

```
string.sup();
```

toLocaleLowerCase**String toLocaleLowerCase ()****Returns****String****Sample**

```
var s = "Have a nice day!";
application.output(s.toLocaleLowerCase());
```

toLocaleUpperCase**String toLocaleUpperCase ()****Returns****String****Sample**

```
var s = "Have a nice day!";
application.output(s.toLocaleUpperCase());
```

toLowerCase**String toLowerCase ()**

returns a string with all lowercase letters of the current string.

Returns**String****Sample**

```
string.toLowerCase();
```

toUpperCase**String toUpperCase ()**

returns a string with all uppercase letters of the current string.

Returns**String****Sample**

```
string.toUpperCase();
```
