

JSNDEvent

Constants Summary

String	<code>#ACTION</code>	Constant returned by JSEvent.
String	<code>#DATACHANGE</code>	Constant returned by JSEvent.
String	<code>#DOUBLECLICK</code>	Constant returned by JSEvent.
String	<code>#FOCUSGAINED</code>	Constant returned by JSEvent.
String	<code>#FOCUSLOST</code>	Constant returned by JSEvent.
String	<code>#FORM</code>	Constant returned by JSEvent.
Number	<code>#MODIFIER_ALT</code>	Constant for the ALT modifier that can be returned by JSEvent.
Number	<code>#MODIFIER_CTRL</code>	Constant for the CTRL modifier that can be returned by JSEvent.
Number	<code>#MODIFIER_META</code>	Constant for the META modifier that can be returned by JSEvent.
Number	<code>#MODIFIER_SHIFT</code>	Constant for the SHIFT modifier that can be returned by JSEvent.
String	<code>#NONE</code>	Constant returned by JSEvent.
String	<code>#ONDRA</code>	Constant returned by JSEvent.
String	<code>#ONDRA</code>	Constant returned by JSEvent.
String	<code>#ONDRA</code>	Constant returned by JSEvent.
String	<code>#ONDRA</code>	Constant returned by JSEvent.
String	<code>#ONDRA</code>	Constant returned by JSEvent.
String	<code>#ONDRAGEND</code>	Constant returned by JSEvent.
String	<code>#ONDRAGOVER</code>	Constant returned by JSEvent.
String	<code>#ONDROP</code>	Constant returned by JSEvent.
String	<code>#RIGHTCLICK</code>	Constant returned by JSEvent.

Property Summary

Object	<code>#data</code>	A data object that specific events can set, a user can set data back to the system for events that supports this.
String	<code>#dataMimeType</code>	The event data mime type.

Method Summary

Number	<code>#getDragResult()</code>	Returns the result of the drag action.
String	<code>#getElementName()</code>	returns the name of the element, can be null if the form was the source of the event.
String	<code>#getFormName()</code>	returns the name of the form the element was placed on.
Number	<code>#getModifiers()</code>	Returns the modifiers of the event, see JSEvent.
JSRecord	<code>#getRecord()</code>	Returns the record of the event.
Object	<code>#getSource()</code>	returns the source component/element of the event.
Date	<code>#getTimestamp()</code>	Returns the time the event occurred.
String	<code>#getType()</code>	returns the event type see the JSEvents constants what it can return.
Number	<code>#getX()</code>	Returns the x position of the event, relative to the component that fired it, if applicable.
Number	<code>#getY()</code>	Returns the y position of the event, relative to the component that fired it, if applicable.

Constants Details

ACTION

Constant returned by JSEvent.getType() in a method that is attached to an onAction event.

Returns

String

Sample

```
if (event.getType() == JSEvent.ACTION)
{
    // its an action event.
}
```

DATACHANGE

Constant returned by JSEvent.getType() in a method that is attached to an onDataChange event.

Returns

String

Sample

```
if (event.getType() == JSEvent.DATACHANGE)
{
    // its a data change event
}
```

DOUBLECLICK

Constant returned by JSEvent.getType() in a method that is attached to an onDoubleClick event.

Returns

String

Sample

```
if (event.getType() == JSEvent.DOUBLECLICK)
{
    // its a double click event.
}
```

FOCUSGAINED

Constant returned by JSEvent.getType() in a method that is attached to an onFocusGained or the forms onElementFocusGained event.

Returns

String

Sample

```
if (event.getType() == JSEvent.FOCUSGAINED)
{
    // its a focus gained event.
}
```

FOCUSLOST

Constant returned by JSEvent.getType() in a method that is attached to an onFocusLost or the forms onElementFocusLost event.

Returns

String

Sample

```
if (event.getType() == JSEvent.FOCUSLOST)
{
    // its a focus lost event.
}
```

FORM

Constant returned by JSEvent.getType() in a method that is attached to a form event (like onShow) or command (like onDeleteRecord)

Returns

String

Sample

```
if (event.getType() == JSEvent.FORM)
{
    // its a form event or command
}
```

MODIFIER_ALT

Constant for the ALT modifier that can be returned by JSEvent.getModifiers();

Returns

Number

Also see

[.getModifiers](#)

Sample

```
//test if the SHIFT modifier is used.
if (event.getModifiers() & JSEvent.MODIFIER_SHIFT)
{
    //do shift action
}
```

MODIFIER_CTRL

Constant for the CTRL modifier that can be returned by JSEvent.getModifiers();

Returns

Number

Also see

[.getModifiers](#)

Sample

```
//test if the SHIFT modifier is used.
if (event.getModifiers() & JSEvent.MODIFIER_SHIFT)
{
    //do shift action
}
```

MODIFIER_META

Constant for the META modifier that can be returned by JSEvent.getModifiers();

Returns

Number

Also see

[.getModifiers](#)

Sample

```
//test if the SHIFT modifier is used.
if (event.getModifiers() & JSEvent.MODIFIER_SHIFT)
{
    //do shift action
}
```

MODIFIER_SHIFT

Constant for the SHIFT modifier that can be returned by JSEvent.getModifiers();

Returns

Number

Also see

[.getModifiers](#)

Sample

```
//test if the SHIFT modifier is used.  
if (event.getModifiers() & JSEvent.MODIFIER_SHIFT)  
{  
    //do shift action  
}
```

NONE

Constant returned by JSEvent.getType() if the event is not used in a known event or command.

Returns

String

Sample

```
if (event.getType() == JSEvent.NONE)  
{  
    // type is not set.  
}
```

ONDRA

Constant returned by JSEvent.getType() in a method that is attached to an onDrag event.

Returns

String

Sample

```
if (event.getType() == JSEvent.ONDRAG)  
{  
    // its an ondrag event  
    if (event.getElementName() == 'todragelement')  
        return DRAGNDROP.COPY  
}
```

ONDRAEND

Constant returned by JSEvent.getType() in a method that is attached to an onDragEnd event.

Returns

String

Sample

```
if (event.getType() == JSEvent.ONDRAGEND)  
{  
    // its an on drag end event.  
    // return true if the drop has been completed successfully  
    return event.isDropSuccess();  
}
```

ONDRAFTER

Constant returned by JSEvent.getType() in a method that is attached to an onDragOver event.

Returns

String

Sample

```
if (event.getType() == JSEvent.ONDRAGOVER)
{
    // its an on drag over event.
    // return true if it over the right element.
    return event.getElementName() == 'candroponelement';
}
```

ONDROP

Constant returned by JSEvent.getType() in a method that is attached to an onDrop event.

Returns

String

Sample

```
if (event.getType() == JSEvent.ONDROP)
{
    // its a on drop event.
    var element = elements[event.getElementName()];
    // do drop on element
    return true;
}
```

RIGHTCLICK

Constant returned by JSEvent.getType() in a method that is attached to an onRightClick event.

Returns

String

Sample

```
if (event.getType() == JSEvent.RIGHTCLICK)
{
    // its a right click event.
}
```

Property Details

data

A data object that specific events can set, a user can set data back to the system for events that supports this.

Returns

Object

Sample

```
// A client design method that handles ondrag
if (event.getType() == JSEvent.ONDRAG)
{
    // the data is the selected elements array
    var elements = event.data;
    // only start a client design drag when there is 1 element
    if (elements.length == 1)
    {
        return true;
    }
}

// code for a data drag method
event.data = "drag me!";
return DRAGNDROP.COPY;

// code for a data drop method
var data = event.data;
elements[event.getElementName()].setText(data);
return true;
```

dataMimeType

The event data mime type.

Returns

String

Sample

```
// only accept drag if data is a servoy record
function onDragOver(event)
{
    if(event.dataMimeType.indexOf("application/x-servoy-record-object") == 0) return true;
    else return false;
}
```

Method Details

getDragResult

Number **getDragResult()**

Returns the result of the drag action.

Returns

Number – a DRAGNDROP constant, representing the result of the drag action

Sample

```
function onDragEnd(event)
{
    var dragResult = event.getDragResult();
    if(dragResult == DRAGNDROP.NONE)
    {
        // the drag was canceled
    }
    else if(dragResult == DRAGNDROP.COPY)
    {
        // the drag ended with a copy action
    }
    else if(dragResult == DRAGNDROP.MOVE)
    {
        // the drag ended with a move action
    }
}
```

getElementsName

String getElementsName()

returns the name of the element, can be null if the form was the source of the event.

Returns

String – a String representing the element name.

Sample

```
if (event.getElementsName() == 'myElement')
{
    elements[event.getElementsName()].bgcolor = '#ff0000';
}
```

getFormName

String getFormName()

returns the name of the form the element was placed on.

Returns

String – a String representing the form name.

Sample

```
forms[event.getFormName()].myFormMethod();
```

getModifiers

Number getModifiers()

Returns the modifiers of the event, see JSEvent.MODIFIER_XXXX for the modifiers that can be returned.

Returns

Number – an int which holds the modifiers as a bitset.

Sample

```
//test if the SHIFT modifier is used.
if (event.getModifiers() & JSEvent.MODIFIER_SHIFT)
{
    //do shift action
}
```

getRecord

JSRecord getRecord()

Returns the record of the event.

Returns

JSRecord – Record of the event

Sample

```
event.Record();
```

getSource

Object getSource()

returns the source component/element of the event.

If it has a name the getElementName() is the name of this component.

Returns

Object – an Object representing the source of this event.

Sample

```
var sourceDataProvider = event.getSource().getDataProviderID();
```

getTimestamp

Date getTimestamp()

Returns the time the event occurred.

Returns

Date – a Date when this event happened.

Sample

```
event.getTimestamp();
```

getType

String getType()

returns the event type see the JSEvents constants what it can return.

Plugins can create events with their own types.

Returns

String – a String representing the type of this event.

Sample

```
if (event.getType() == JSEvent.ACTION)
{
    // its an action event.
}
```

getX

Number getX()

Returns the x position of the event, relative to the component that fired it, if applicable.

For example drag'n'drop events will set the x,y positions.

Returns

Number – an int representing the X position.

Sample

```
var x = event.getX();
var xPrevious = previousEvent.getX();
var movedXPixels = x -xPrevious;
```

getY

Number getY()

Returns the y position of the event, relative to the component that fired it, if applicable.

For example drag'n'drop events will set the x,y positions.

Returns

Number – an int representing the Y position.

Sample

```
var y = event.getY();
var yPrevious = previousEvent.getY();
var movedYPixels = y -yPrevious;
```
